**TABLE OF CONTENTS**

Appendix 1.1 TAC Members .....	Page 1
Appendix 1.2 Work Plan .....	5
Appendix 2.1 IRP Regulatory Guidelines .....	11
Appendix 2.2 Comments & Responses to 2009 DRAFT IRP .....	29
Appendix 3.1 Customer Forecasts .....	45
Appendix 3.2 Customer Forecasts Data .....	57
Appendix 3.3 Demand Coefficients .....	71
Appendix 3.4 Heating Degree Day (HDD) Data.....	85
Appendix 3.5 Global Warming Summary and Graphs.....	91
Appendix 3.6 Alternate Demand Scenarios Summary of Assumptions.....	107
Appendix 3.7 Alternate Demand Scenarios Descriptions .....	113
Appendix 3.8 Annual and Peak Day Demand Data .....	123
Appendix 3.9 Annual Demand by Region Before and After DSM.....	131
Appendix 3.10 Detail Demand Data.....	141
Appendix 4.1 DSM Implementation and Operations .....	159
Appendix 4.2 Conservation Measures Detail .....	171
Appendix 4.3 SENDOUT <sup>®</sup> selected Conservation Measures .....	179
Appendix 4.4 Environmental Externalities.....	223
Appendix 5.1 Current Transportation Rates .....	229

---

Appendix 5.2 Alternate Supply Scenarios Summary of Assumptions .....	233
Appendix 6.1 Monthly Price Data .....	237
Appendix 6.2 General Assumptions .....	251
Appendix 6.3 Supply Side Resource Options .....	259
Appendix 6.4 Avoided Cost Detail.....	265
Appendix 6.5 SENDOUT® Model Diagram .....	283
Appendix 7.1 Sensitivities, Scenarios, Simulations and Portfolios List .....	287
Appendix 7.2 Demand and Expected Resource Graphs .....	291
Appendix 7.3 Peak Day Demand Served and Unserved Table .....	299
Appendix 7.4 Load Duration Curve Graphs (High and Low Growth Cases) .....	307
Appendix 7.5 Total Cost By Portfolio.....	311
Appendix 8.1 Distribution System Modeling.....	319

## **APPENDIX 1.1**

### **TAC MEMBERS**

**Appendix 1.1**  
**2009 IRP TAC Member List**

---

<u>Name</u>	<u>Organization</u>
Bob Jenks	Oregon CUB
Bruce Folsom	Avista
Carrie Dolwick	NW Energy
Chau Lau	Cascade Natural Gas Company
Dan Kirschner	Northwest Gas Association
Dave Allred	Northwest Pipeline
Dave Sloan	Gas Transmission Northwest
David Nightingale	WUTC
Deborah Reynolds	WUTC
Greg Rahn	Avista
Gurvinder Singh	Puget Sound Energy
Inara Scott	Northwest Natural
Joe Ross	Gas Transmission Northwest
Jon Powell	Avista
Kelly Irvine	Avista
Ken Ross	Terasen Gas
Kerry Shroy	Avista
Ken Zimmerman	OPUC
Kevin Christie	Avista
Lea Daischel	Washington Attorney General's Office
Linda Gervais	Avista
Lisa Gorsuch	OPUC
Lori Hermanson	Avista
Lynn Kittilson	OPUC
Mark Sellers-Vaughn	Cascade Natural Gas Company
Matt Elam	IPUC
Megan Clark	Northwest Gas Association
Paula Pyron	Northwest Industrial Gas Users
Randy Barcus	Avista
Rich Cowan	Gas Transmission Northwest
Steven Johnson	WUTC
Steven Simmons	Northwest Natural
Terrence Browne	Avista
Terri Carlock	IPUC
Terry Morlan	Northwest Power and Conservation Council
Vonda Novak	WUTC

## **APPENDIX 1.2**

### **WORK PLAN**

## **Avista Corporation 2009 Natural Gas Integrated Resource Plan Work Plan**

### **IRP Work Plan Requirements**

Section 480-90-238 (4), of the natural gas Integrated Resource Plan (“IRP”) rules, specify requirements for the IRP Work Plan:

Not later than twelve months prior to the due date of a plan, the utility must provide a work plan for informal commission review. The work plan must outline the content of the integrated resource plan to be developed by the utility and the method for assessing potential resources.

Additionally, Section 480-90-238 (5) of the WAC states:

The work plan must outline the timing and extent of public participation.

### **Overview**

This Work Plan outlines the process Avista will follow to complete its 2009 Natural Gas IRP by December 31, 2009. Avista uses a public process to obtain technical expertise and guidance throughout the planning period via Technical Advisory Committee (TAC) meetings. The TAC provided input into this work plan and will be providing input into assumptions, scenarios, and modeling techniques.

### **Process**

The 2009 IRP process will be similar to that used to produce the previously published plan. Avista will use SENDOUT® (a PC based linear programming model widely used to solve natural gas supply and transportation optimization questions) to develop the risk adjusted least-cost resource mix for the 20 year planning period.

For this plan, Avista intends to incorporate action plan items identified in the 2007 Natural Gas IRP including regional demand modeling, weather standard evaluation, Canadian natural gas imports monitoring, and analyze (using SENDOUT® and VectorGas™) realistic alternative situations in which the company may have to operate during the next 20 years. VectorGas™ is the Monte Carlo risk assessment element of SENDOUT® which evaluates the cost and reliability impact of market price and demand volatility.

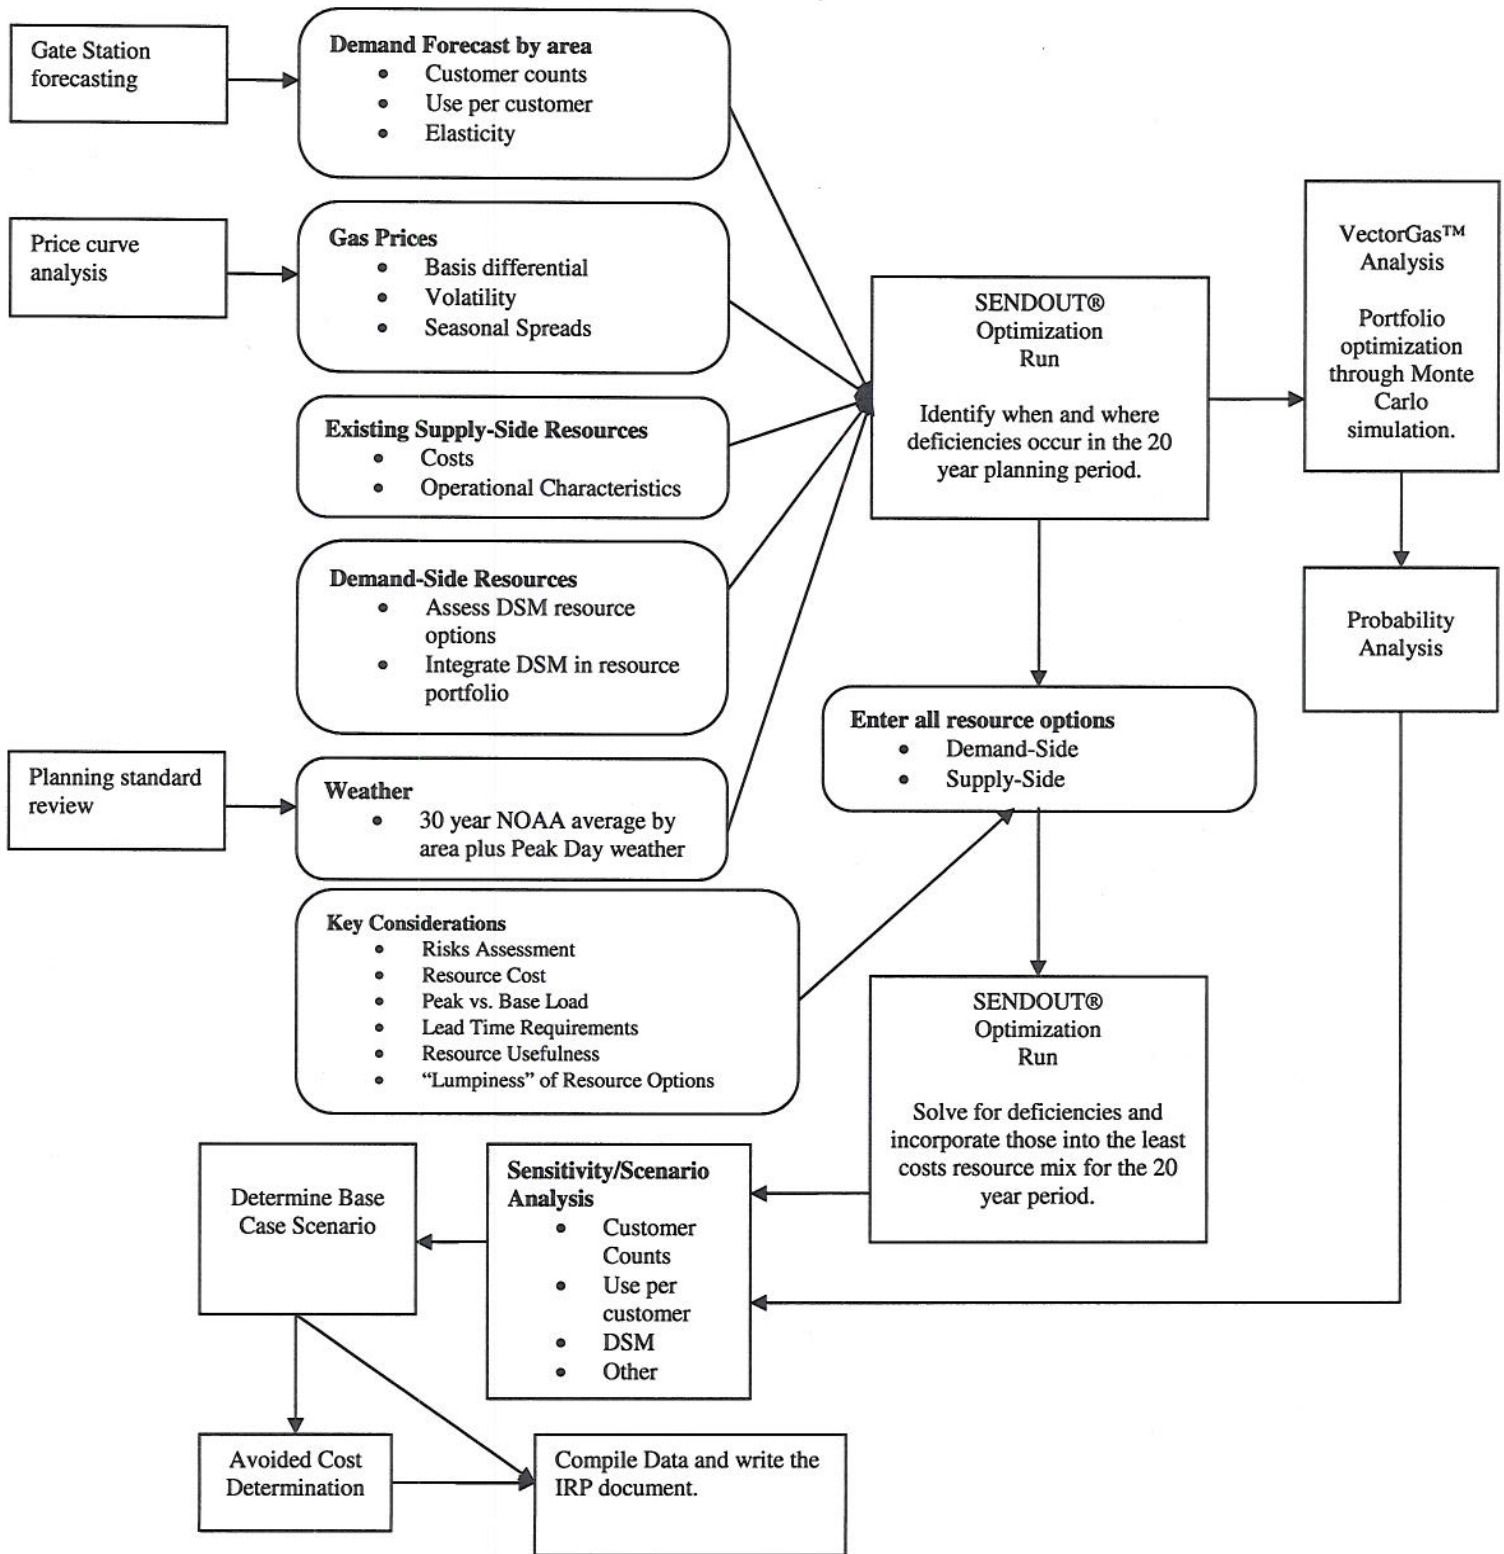

This plan will continue to include demand analysis, detailed demand side management program analysis and avoided cost determination, distribution planning, existing and potential supply-side resource analysis and resource integration. Further details about Avista's process for determining the risk adjusted least-cost resource mix is shown in Exhibit 1.

## **Timeline**

The following is Avista's TENTATIVE 2009 Natural Gas IRP timeline:

- **December 29, 2008** – Work Plan filed with WUTC
- **April through July 2009** – Technical Advisory Committee meetings (exact meeting dates *subject to change*). Meeting topics will include:
  - Demand Forecast & Demand-Side Management – April 28
  - Distribution Planning & Supply/Infrastructure – May 19
  - SENDOUT® Preliminary Output Results and Potential Case Discussion – June 16
  - SENDOUT® and VectorGas™ results – July 16
- **September 1, 2009** – Draft of IRP document to TAC
- **October 30, 2009** – Comments on draft due back to Avista
- **November 6, 2009** – TAC final review meeting (if necessary)
- **December 31, 2009** – File finalized IRP document

# Exhibit 1: Avista's 2009 Natural Gas IRP Modeling Process

## **APPENDIX 2.1**

### **IRP REGULATORY GUIDELINES**

## Appendix 2.1 IDAHO Public Utility Commission IRP Policies and Guidelines - ORDER NO. 25342

REF #	DESCRIPTION OF REQUIREMENT	FULLFILLMENT OF REQUIREMENT
1	<p>Purpose and Process. Each gas utility regulated by the Idaho Public Utilities Commission with retail sales of more than 10,000,000,000 cubic feet in a calendar year (except gas utilities doing business in Idaho that are regulated by contract with a regulatory commission of another State) has the responsibility to meet system demand at least cost to the utility and its ratepayers. Therefore, an “integrated resource plan” shall be developed by each gas utility subject to this rule.</p>	<p>Avista prepares a comprehensive 20 year Integrated Resource Plan every two years. Avista will be filing its 2009 IRP on or before December 31, 2009.</p>
2	<p>Definition. Integrated resource planning. “Integrated resource planning” means planning by the use of any standard, regulation, practice, or policy to undertake a systematic comparison between demand-side management measures and the supply of gas by a gas utility to minimize life-cycle costs of adequate and reliable utility services to gas customers. Integrated resource planning shall take into account necessary features for system operation such as diversity, reliability, dispatchability, and other factors of risk and shall treat demand and supply to gas consumers on a consistent and integrated basis.</p>	<p>Avista’s IRP brings together dynamic demand forecasts and matches them against demand-side and supply-side resources in order to evaluate the least cost/best risk portfolio for its core customers.</p>
3	<p>Elements of Plan. Each gas utility shall submit to the Commission on a biennial basis an integrated resource plan that shall include:</p>	<p>2009 IRP to be filed on or before Dec 31, 2009 within 2 years of our 2007 IRP filing.</p>
a.	<p>A range of forecasts of future gas demand in firm and interruptible markets for each customer class for one, five, and twenty years using methods that examine the effect of economic forces on the consumption of gas and that address changes in the number, type and e-efficiency of gas end-uses.</p>	<p>See <b>Chapter 3 - Demand Forecasts</b> and <b>Appendix 2.1 et. al.</b> for a detailed discussion of how demand was forecasted for this IRP.</p>
b.	<p>An assessment for each customer class of the technically feasible improvements in the efficient use of gas, including load management, as well as the policies and programs needed to obtain the efficiency improvements.</p>	<p>See <b>Chapter 4 - Demand Side Management</b> and <b>DSM Appendicies 4.1 et.al.</b> for detailed information on the DSM measures evaluated and selected for this IRP and the implementation process.</p>

## Appendix 2.1 IDAHO Public Utility Commission IRP Policies and Guidelines - ORDER NO. 25342

REF #	DESCRIPTION OF REQUIREMENT	FULLFILLMENT OF REQUIREMENT
c.	An analysis for each customer class of gas supply options, including: (1) a projection of spot market versus long-term purchases for both firm and interruptible markets; (2) an evaluation of the opportunities for using company-owned or contracted storage or production; (3) an analysis of prospects for company participation in a gas futures market; and (4) an assessment of opportunities for access to multiple pipeline suppliers or direct purchases from producers.	See <b>Chapter 5 - Supply-Side Resources</b> for details about the market, storage, and pipeline transportation as well as other resource options considered in this IRP. See also the procurement plan section in this same chapter for supply procurement strategies.
d.	A comparative evaluation of gas purchasing options and improvements in the efficient use of gas based on a consistent method for calculating cost-effectiveness.	See Methodology section of <b>Chapter 4 - Demand-Side Resources</b> where we describe our process on how demand-side and supply-side resources are compared on par with each other in the SENDOUT® model.
e.	The integration of the demand forecast and resource evaluations into a long-range (e.g., twenty-year) integrated resource plan describing the strategies designed to meet current and future needs at the lowest cost to the utility and its ratepayers.	See <b>Chapter 6 - Integrated Resource Portfolio</b> for details on how we model demand and supply coming together to provide the least cost/best risk portfolio of resources.
f.	A short-term (e.g., two-year) plan outlining the specific actions to be taken by the utility in implementing the integrated resource plan.	See <b>Chapter 8 - Action Plan</b> for actions to be taken in implementing the IRP.
4	Relationship Between Plans. All plans following the initial integrated resource plan shall include a progress report that relates the new plan to the previously filed plan.	Avista strives to meet at least quarterly with Staff and/or Commissioners to discuss the state of the market, procurement planning practices, and any other issues that may impact resource needs or other analysis within the IRP.
5	Plans to Be Considered in Rate Cases. The integrated resource plan will be considered with other available information to evaluate the performance of the utility in rate proceedings before the Commission.	We prepare and file our plan in part to establish a public record of our plan.
6	Public Participation. In formulating its plan, the gas utility must provide an opportunity for public participation and comment and must provide methods that will be available to the public of validating predicted performance.	Avista held four Technical Advisory Committee meetings beginning in April and ending in August. See <b>Chapter 1 - Introduction</b> for more detail about public participation in the IRP process.

## Appendix 2.1 IDAHO Public Utility Commission IRP Policies and Guidelines - ORDER NO. 25342

REF #	DESCRIPTION OF REQUIREMENT	FULLFILLMENT OF REQUIREMENT
7	<p>Legal Effect of Plan. The plan constitutes the base line against which the utility's performance will ordinarily be measured. The requirement for implementation of a plan does not mean that the plan must be followed without deviation. The requirement of implementation of a plan means that a gas utility, having made an integrated resource plan to provide adequate and reliable service to its gas customers at the lowest system cost, may and should deviate from that plan when presented with responsible, reliable opportunities to further lower its planned system cost not anticipated or identified in existing or earlier plans and not undermining the utility's reliability.</p> <p>In order to encourage prudent planning and prudent deviation from past planning when presented with opportunities for improving upon a plan, a gas utility's plan must be on file with the Commission and available for public inspection. But the filing of a plan does not constitute approval or disapproval of the plan having the force and effect of law, and deviation from the plan would not constitute violation of the Commission's Orders or rules. The prudence of a utility's plan and the utility's prudence in following or not following a plan are matters that may be considered in a general rate proceeding or other proceedings in which those issues have been noticed.</p>	<p>See section titled "Avista's Procurement Plan" in <b>Chapter 5 - Supply-Side Resources</b>. Among other details we discuss plan revisions in response to changing market conditions.</p> <p>See also section titled "Alternate Supply-Side Scenarios" in <b>Chapter 6 - Integrated Resource Portfolio</b> where we discuss different supply portfolios that are responsive to changing assumptions about resource alternatives.</p>

## Appendix 2.1 Oregon Public Utility Commission IRP Standard and Guidelines – Order 07-002

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>Guideline 1: Substantive Requirements</b>		
<b>1.a.1</b>	All resources must be evaluated on a consistent and comparable basis.	All resource options including demand-side and supply-side are modeled in SENDOUT® utilizing the same common general assumptions, approach and methodology.
<b>1.a.2</b>	All known resources for meeting the utility's load should be considered, including supply-side options which focus on the generation, purchase and transmission of power – or gas purchases, transportation, and storage – and demand-side options which focus on conservation and demand response.	Avista considered a range of resources including demand-side management, distribution system enhancements, interstate pipeline transportation, transport backhauls, and storage options including liquefied natural gas. Chapter 4 and Appendix 4.3 documents Avista's demand-side management resources considered. Chapter 5 and Appendix 6.3 documents supply-side resources. Chapter 6 documents how Avista developed and assessed each of these resources.
<b>1.a.3</b>	Utilities should compare different resource fuel types, technologies, lead times, in-service dates, durations and locations in portfolio risk modeling.	Avista considered various combinations of technologies, lead times, in-service dates, durations, and locations. Chapter 6 provides details about the modeling methodology and results. Chapter 5 describes resource attributes and Appendix 6.3 summarizes the resources' lead times, in-service dates and locations.
<b>1.a.4</b>	Consistent assumptions and methods should be used for evaluation of all resources.	Appendix 6.2 documents general assumptions used in Avista's SENDOUT® modeling software. All portfolio resources both demand and supply-side were evaluated within SENDOUT® using the same sets of inputs.
<b>1.a.5</b>	The after-tax marginal weighted-average cost of capital (WACC) should be used to discount all future resource costs.	Avista applied its after-tax WACC of 4.18% to discount all future resource costs. (See general assumptions at Appendix 6.2)
<b>1.b.1</b>	Risk and uncertainty must be considered. Electric utilities only	Not Applicable
<b>1.b.2</b>	Risk and uncertainty must be considered. Natural gas utilities should consider demand (peak, swing and base-load), commodity supply and price, transportation availability and price, and costs to comply with any regulation of greenhouse gas (GHG) emissions.	After considering the influencers on demand, Avista performed 15 sensitivities on demand. From there nine demand scenarios were developed (Table 1.1) for SENDOUT® modeling purposes. Monthly demand coefficients were developed for base, heating demand (Appendix 3.3) while peak demand was contemplated through modeling a weather planning standard of the coldest day on record (see heating degree day data in Appendix 3.4).  Avista evaluated several price forecasts (Figure 6.3) and selected high, medium and low price scenarios for modeling purposes (Figures 6.4 & 6.5).

Guideline Number	Description of Requirement	Fulfillment of Requirement
		<p>An updated price forecast was also analyzed as it incorporated more current market conditions. This forecast became our expected case forecast and is also shown in Figures 6.4 &amp; 6.5.</p> <p>Four supply scenarios were also evaluated, see Table 5.3. These supply scenarios were combined with demand scenarios in order to establish portfolios for evaluation. Ultimately 13 portfolios were evaluated.</p> <p>Avista also ran Monte Carlo simulations using VectorGas™ for price and weather variables to analyze demand sensitivity to weather and to quantify the risk to customers under varying price environments.</p> <p>Avista considered GHG emissions regulatory compliance costs in Appendix 4.2.</p>
	<p>Utilities should identify in their plans any additional sources of risk and uncertainty.</p>	<p>Avista evaluated additional risks and uncertainties. Risks associated with the planning environment are detailed in Chapter 1 Introduction. Avista also analyzed demand risk which is detailed in Chapter 3. Chapter 4 discusses the uncertainty around how much DSM is achievable. Supply-side resource risks are discussed in Chapter 5. Chapter 6 discusses the variables modeled for scenario and stochastic risk analysis.</p>
<b>1c</b>	<p>The primary goal must be the selection of a portfolio of resources with the best combination of expected costs and associated risks and uncertainties for the utility and its customers.</p> <p>The planning horizon for analyzing resource choices should be at least 20 years and account for end effects. Utilities should consider all costs with a reasonable likelihood of being included in rates over the long term, which extends beyond the planning horizon and the life of the resource.</p> <p>Utilities should use present value of revenue requirement (PVRR) as the key cost metric. The plan should include analysis of current and estimated future costs of all long-lived resources such as power plants, gas storage facilities and pipelines, as well as all short-lived resources such as gas supply and short-term power purchases.</p>	<p>Avista evaluated cost/risk tradeoffs for each of the risk analysis portfolios considered.</p> <p>See Chapter 6 and supporting information at Appendix 6.8 for Avista's portfolio risk analysis and determination of the preferred portfolio.</p> <p>Avista used a 20-year study period for portfolio modeling. Avista contemplated possible costs beyond the planning period that could affect rates including end effects such as infrastructure decommission costs and concluded there were no significant costs reasonably likely to impact rates under different resource selection scenarios.</p> <p>Avista's SENDOUT® modeling software utilizes a PVRR cost metric methodology applied to both long and short-lived resources.</p>

Guideline Number	Description of Requirement	Fulfillment of Requirement
	To address risk, the plan should include at a minimum: 1) Two measures of PVRR risk: one that measures the variability of costs and one that measures the severity of bad outcomes. 2) Discussion of the proposed use and impact on costs and risks of physical and financial hedging.	Avista, through its VectorGas™ software, modeled 200 scenarios around varying gas price inputs via Monte Carlo iterations developing a distribution of Total 20 year cost estimates utilizing SENDOUT@'s PVRR methodology. Chapter 6 further describes this analysis while Figure 6.35 summarizes this analysis graphically. The variability of costs is plotted against the Expected Case while the scenarios beyond the 95 <sup>th</sup> percentile capture the severity of bad outcomes.  Chapter 5 discusses Avista's physical and financial hedging methodology.
	The utility should explain in its plan how its resource choices appropriately balance cost and risk.	Chapter 6 Regulatory Requirements section summarizes the results of Avista's cost/risk tradeoff analysis considered throughout the IRP process. Chapter 5 and 6 describe various specific resource considerations and related risks, and describes what criteria we used to determine what resource combinations provide an appropriate balance between cost and risk.
<b>1d</b>	The plan must be consistent with the long-run public interest as expressed in Oregon and federal energy policies.	Avista considered current and expected state and federal energy policies in portfolio modeling. Chapter 6 describes the decision process used to derive portfolios, which includes consideration of state resource policy directions.
<b>Guideline 2: Procedural Requirements</b>		
<b>2a</b>	The public, including other utilities, should be allowed significant involvement in the preparation of the IRP. Involvement includes opportunities to contribute information and ideas, as well as to receive information. Parties must have an opportunity to make relevant inquiries of the utility formulating the plan.  While confidential information must be protected, the utility should make public, in its plan, any non-confidential information that is relevant to its resource evaluation and action plan.	Chapter 1 provides an overview of the public process and documents the details on public meetings held for the 2009 IRP.  The entire IRP, as well as the TAC process, includes all of the non-confidential information the company used for portfolio evaluation and selection. Avista also provided stakeholders with non-confidential information to support public meeting discussions via email. The draft plan and subsequent TAC meeting presentations were also made available on Avista's website for public viewing during this period.  Avista distributed a draft IRP document for external review to TAC members on September 4, 2009 and requested comments by October 15, 2009. The draft plan was also made available on Avista's website for public viewing during this period.
	The utility must provide a draft IRP for public review and comment prior to filing a final plan with the Commission.	

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>Guideline 3: Plan Filing, Review and Updates</b>		
<b>3a</b>	Utility must file an IRP within two years of its previous IRP acknowledgement order.	This Plan complies with this requirement as the 2007 Natural Gas IRP was acknowledged on 6/02/2008.
<b>3b</b>	Utility must present the results of its filed plan to the Commission at a public meeting prior to the deadline for written public comment.	Avista will work with Staff to fulfill this guideline following filing of the IRP.
<b>3c - g</b>	These guides discuss Commission comments and acknowledgement and the IRP annual update.	Not applicable.
<b>Guideline 4: Plan Components</b>		
<b>4a</b>	At a minimum, the plan must include the following elements: An explanation of how the utility met each of the substantive and procedural requirements.	This table summarizes guideline compliance by providing an overview of how Avista met each of the substantive and procedural requirements for a natural gas IRP.
<b>4b</b>	Analysis of high and low load growth scenarios in addition to stochastic load risk analysis with an explanation of major assumptions.	Avista developed nine demand growth forecasts for scenario analysis. Stochastic variability of demand was also captured in the risk analysis. Chapter 2 describes the demand forecast data and Chapter 6 provides the scenario and risk analysis results. Appendix 6.2 details major assumptions.
<b>4c</b>	For electric utilities only	Not Applicable
<b>4d</b>	A determination of the peaking, swing and base-load gas supply and associated transportation and storage expected for each year of the plan, given existing resources; and identification of gas supplies (peak, swing and base-load), transportation and storage needed to bridge the gap between expected loads and resources.	Figures 1.11 and 1.12 summarize graphically projected annual peak day demand and the existing and selected resources by year to meet demand for the expected case. Appendix 6.6 summarizes the high, low, and other demand scenarios.
<b>4e</b>	Identification and estimated costs of all supply-side and demand-side resource options, taking into account anticipated advances in technology	Chapter 4 and Appendix 4.3 identify the demand-side resources included in this IRP. Chapter 5 and 6 and Appendix 6.3 identify the supply-side resources.
<b>4f</b>	Analysis of measures the utility intends to take to provide reliable service, including cost-risk tradeoffs.	Chapter 7 discusses the modeling tools, customer growth forecasting and cost-risk considerations used to maintain and plan a reliable gas delivery system. The Chapter also captures a summary of the reliability analysis process demonstrated at the second TAC meeting.  Chapter 5 discusses the diversified infrastructure and multiple supply basin approach that acts to mitigate certain reliability risks.

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>4g</b>	Identification of key assumptions about the future (e.g. fuel prices and environmental compliance costs) and alternative scenarios considered.	Appendix 6.2 and Chapter 6 describe the key assumptions and alternative scenarios used in this IRP.
<b>4h</b>	Construction of a representative set of resource portfolios to test various operating characteristics, resource types, fuels and sources, technologies, lead times, in-service dates, durations and general locations - system-wide or delivered to a specific portion of the system.	This Plan documents the development and results for portfolios evaluated in this IRP (see Table 5.3 for supply scenarios considered).
<b>4i</b>	Evaluation of the performance of the candidate portfolios over the range of identified risks and uncertainties.	We evaluated our candidate portfolio by performing stochastic analysis using VectorGas™ varying price under 200 different scenarios. Additionally, we test the portfolio of options with the use of SENDOUT® under deterministic scenarios where demand and price vary. For resources selected, we assess other risk factors such as varying lead times required and potential for cost overruns outside of the amounts included in the modeling assumptions.
<b>4j</b>	Results of testing and rank ordering of the portfolios by cost and risk metric, and interpretation of those results	Avista's four distinct geographic Oregon service territories limit many resource option synergies which inherently reduces available portfolio options. Feasibility uncertainty, lead time variability and uncertain cost escalation around certain resource options also reduce reasonably viable options. Chapter 5 describes resource options reviewed including discussion on uncertainties in lead times and costs as well as viability and resource availability (e.g. LNG). Appendix 6.3 summarizes the potential resource options identifying investment and variable costs, asset availability and lead time requirements while results of resources selected are identified in Table 6.5 as well as graphically presented in Figure 6.17 and 6.18 for the expect case and Appendix 6.8 for High and Low demand cases. (Alternate scenarios are in Appendix 6.5)
<b>4k</b>	Analysis of the uncertainties associated with each portfolio evaluated	See the responses to 1.b above.
<b>4l</b>	Selection of a portfolio that represents the best combination of cost and risk for the utility and its customers	Avista evaluated cost/risk tradeoffs for each of the risk analysis portfolios considered. Chapter 6 shows the company's portfolio risk analysis, as well as the process and determination of the preferred portfolio.
<b>4m</b>	Identification and explanation of any inconsistencies of the selected portfolio with any state and federal energy policies that may affect a utility's plan and any barriers to implementation	This IRP is presumed to have no inconsistencies.

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>4n</b>	An action plan with resource activities the utility intends to undertake over the next two to four years to acquire the identified resources, regardless of whether the activity was acknowledged in a previous IRP, with the key attributes of each resource specified as in portfolio testing.	Chapter 8 presents the IRP Action Plan with focus on the following areas: <ul style="list-style-type: none"> <li>Modeling</li> <li>Supply/capacity</li> <li>Forecasting</li> <li>Regulatory communication</li> <li>DSM Goals</li> </ul>
<b>Guideline 5: Transmission</b>		
<b>5</b>	Portfolio analysis should include costs to the utility for the fuel transportation and electric transmission required for each resource being considered. In addition, utilities should consider fuel transportation and electric transmission facilities as resource options, taking into account their value for making additional purchases and sales, accessing less costly resources in remote locations, acquiring alternative fuel supplies, and improving reliability.	Not applicable to Avista's gas utility operations.
<b>Guideline 6: Conservation</b>		
<b>6a</b>	Each utility should ensure that a conservation potential study is conducted periodically for its entire service territory.	Our last third party conservation potential study was in 2005. We expect to conduct a new study prior to our 2011 IRP.  Avista incorporates a comprehensive assessment of the potential for utility acquisition of energy-efficiency resources into the regularly-scheduled Integrated Resource Planning process. The assessment that occurred within this IRP process began with over 300 conceptual measures and applications. This is in addition to the site-specific program coverage of any cost-effective non-residential measure.
<b>6b</b>	To the extent that a utility controls the level of funding for conservation programs in its service territory, the utility should include in its action plan all best cost/risk portfolio conservation resources for meeting projected resource needs, specifying annual savings targets.	In Avista's Action Plan in Chapter 8 we include our conservation programs annual savings targets and reference to Chapter 4 and Appendix 4.1 for the program's specific details.
<b>6c</b>	To the extent that an outside party administers	A discussion on the treatment of conservation programs is included in Chapter 4 while selection methodology is documented in Chapter 6.  Not applicable. See the response for 6.b above.

Guideline Number	Description of Requirement	Fulfillment of Requirement
	conservation programs in a utility's service territory at a level of funding that is beyond the utility's control, the utility should: 1) determine the amount of conservation resources in the best cost/ risk portfolio without regard to any limits on funding of conservation programs; and 2) identify the preferred portfolio and action plan consistent with the outside party's projection of conservation acquisition.	
<b>Guideline 7: Demand Response</b>		
<b>7</b>	Plans should evaluate demand response resources, including voluntary rate programs, on par with other options for meeting energy, capacity, and transmission needs (for electric utilities) or gas supply and transportation needs (for natural gas utilities).	Avista has periodically evaluated conceptual approaches to meeting capacity constraints using demand-response and similar voluntary programs. Technology, customer characteristics and cost issues are hurdles for developing effective programs. See chapter 4 Demand Response section for more discussion.
<b>Guideline 8: Environmental Costs</b>		
<b>8</b>	Utilities should include, in their base-case analyses, the regulatory compliance costs they expect for CO <sub>2</sub> , NO <sub>x</sub> , SO <sub>2</sub> , and Hg emissions. Utilities should analyze the range of potential CO <sub>2</sub> regulatory costs in Order No. 93-695, from \$0 - \$40 (1990\$). In addition, utilities should perform sensitivity analysis on a range of reasonably possible cost adders for NO <sub>x</sub> , SO <sub>2</sub> , and Hg, if applicable.	Avista's current direct gas distribution system infrastructure does not result in any CO <sub>2</sub> , NO <sub>x</sub> , SO <sub>2</sub> , or Hg emissions. Upstream gas system infrastructure (pipelines, storage facilities, and gathering systems) do produce CO <sub>2</sub> emissions via compressors used to pressurize and move gas throughout the system. The Environmental Externalities discussion in Appendix 4.2 describes our analysis performed. See also the guidelines addendum reflecting revised guidance for environmental costs per Order 08-339.
<b>Guideline 9: Direct Access Loads</b>		
<b>9</b>	An electric utility's load-resource balance should exclude customer loads that are effectively committed to service by an alternative electricity supplier.	Not applicable to Avista's gas utility operations.
<b>Guideline 10: Multi-state utilities</b>		
<b>10</b>	Multi-state utilities should plan their generation and transmission systems, or gas supply and delivery, on an integrated-system basis that	The 2009 IRP conforms to the multi-state planning approach.

Guideline Number	Description of Requirement	Fulfillment of Requirement
	achieves a best cost/risk portfolio for all their retail customers.	
<b>Guideline 11: Reliability</b>		
<b>11</b>	<p>Electric utilities should analyze reliability within the risk modeling of the actual portfolios being considered. Loss of load probability, expected planning reserve margin, and expected and worst-case unserved energy should be determined by year for top-performing portfolios. Natural gas utilities should analyze, on an integrated basis, gas supply, transportation, and storage, along with demand-side resources, to reliably meet peak, swing, and base-load system requirements. Electric and natural gas utility plans should demonstrate that the utility's chosen portfolio achieves its stated reliability, cost and risk objectives.</p>	<p>Avista's storage and transport resources while planned around meeting a peak day planning standard, also provides opportunities to capture off season pricing while providing system flexibility to meet swing and base-load requirements. Diversity in our transport options enables at least dual fuel source options in event of a transport disruption. For areas with only one fuel source option the cost of duplicative infrastructure is not feasible relative to the risk of generally high reliability infrastructure.</p>
<b>Guideline 12: Distributed Generation</b>		
<b>12</b>	<p>Electric utilities should evaluate distributed generation technologies on par with other supply-side resources and should consider, and quantify where possible, the additional benefits of distributed generation.</p>	<p>Not applicable to Avista's gas utility operations.</p>
<b>Guideline 13: Resource Acquisition</b>		
<b>13a</b>	<p>An electric utility should: identify its proposed acquisition strategy for each resource in its action plan; Assess the advantages and disadvantages of owning a resource instead of purchasing power from another party; identify any Benchmark Resources it plans to consider in competitive bidding.</p>	<p>Not applicable to Avista's gas utility operations.</p>
<b>13b</b>	<p>Natural gas utilities should either describe in the IRP their bidding practices for gas supply and transportation, or provide a description of those practices following IRP acknowledgment.</p>	<p>A discussion of Avista's procurement practices is detailed in Chapter 5.</p>

**Appendix 2.1 Oregon Public Utility Commission IRP Standard and Guidelines – Order 08 - 339**

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>Guideline 8: Environmental Costs</b>		
<b>a.</b>	<p><b>BASE CASE AND OTHER COMPLIANCE SCENARIOS:</b> The utility should construct a base-case scenario to reflect what it considers to be the most likely regulatory compliance future for carbon dioxide (CO<sub>2</sub>), nitrogen oxides, sulfur oxides, and mercury emissions. The utility also should develop several compliance scenarios ranging from the present CO<sub>2</sub> regulatory level to the upper reaches of credible proposals by governing entities. Each compliance scenario should include a time profile of CO<sub>2</sub> compliance requirements. The utility should identify whether the basis of those requirements, or “costs”, would be CO<sub>2</sub> taxes, a ban on certain types of resources, or CO<sub>2</sub> caps (with or without flexibility mechanisms such as allowance or credit trading or a safety valve). The analysis should recognize significant and important upstream emissions that would likely have a significant impact on its resource decisions. Each compliance scenario should maintain logical consistency, to the extent practicable, between the CO<sub>2</sub> regulatory requirements and other key inputs.</p>	<p>Avista’s current direct gas distribution system infrastructure does not result in any CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>2</sub>, or Hg emissions. Upstream gas system infrastructure (pipelines, storage facilities, and gathering systems) do produce CO<sub>2</sub> emissions via compressors used to pressurize and move gas throughout the system.</p> <p>The Environmental Externalities discussion in Chapter 4 describes our process for addressing these costs.</p>
<b>b.</b>	<p><b>TESTING ALTERNATIVE PORTFOLIOS AGAINST THE COMPLIANCE SCENARIOS:</b> The utility should estimate, under each of the compliance scenarios, the present value of revenue requirement (PVRR) costs and risk measures, over at least 20 years, for a set of reasonable alternative portfolios from which the preferred portfolio is selected. The utility should incorporate end-effect considerations in the analyses to allow for comparisons of portfolios containing resources with economic or physical lives that extend beyond the planning period. The utility should also modify projected lifetimes as necessary to be consistent with the compliance scenario under analysis. In addition, the utility should include, if material, sensitivity analyses on a range of reasonably possible regulatory futures for nitrogen oxides, sulfur oxides, and mercury to further inform the preferred portfolio selection.</p>	<p>The Environmental Externalities discussion in Chapter 4 describes our process for addressing these costs.</p>

Guideline Number	Description of Requirement	Fulfillment of Requirement
<b>c.</b>	<p>TRIGGER POINT ANALYSIS: The utility should identify as least one CO<sub>2</sub> compliance “turning point” scenario which, if anticipated now, would lead to, or “trigger” the selection of a portfolio of resources that is substantially different from the preferred portfolio. The utility should develop a substitute portfolio appropriate for this trigger-point scenario and compare the substitute portfolio’s expected cost and risk performance to that of the preferred portfolio – under the base case and each of the above CO<sub>2</sub> compliance scenarios. The utility should provide its assessment of whether a CO<sub>2</sub> regulatory future that is equally or more stringent than the identified trigger point will be mandated.</p>	<p>The Environmental Externalities discussion in Chapter 4 describes our process for addressing these costs.</p>
<b>d.</b>	<p>OREGON COMPLIANCE PORTFOLIO: If none of the above portfolios is consistent with Oregon energy policies (including state goals for reducing greenhouse gas emissions) as those policies are applied to the utility, the utility should construct the best cost/risk portfolio that achieves that consistency, present its cost and risk parameters, and compare it to those of the preferred and alternative portfolios.</p>	<p>The Environmental Externalities discussion in Chapter 4 describes our process for addressing these costs.</p>

Avista Natural Gas IRP Review**

<b>Rule</b>	<b>Requirement</b>	<b>Plan Citation</b>	<b>Notes</b>
WAC 480-90-238(2)(b)	LRC analysis considers need for security of supply.	See Chapter 5 on Supply Side Resources	
WAC 480-90-238(2)(c)	Plan defines conservation as any reduction in natural gas consumption that results from increases in the efficiency of energy use or distribution.	See Chapter 4 on Demand Side Resources	
WAC 480-90-238(3)(a)	Plan includes a range of forecasts of future demand.	See Chapter 3 on Demand Forecast	
WAC 480-90-238(3)(a)	Plan develops forecasts using methods that examine the effect of economic forces on the consumption of natural gas.	See Chapter 3 on Demand Forecast	
WAC 480-90-238(3)(a)	Plan develops forecasts using methods that address changes in the number, type and efficiency of natural gas end-uses.	See Chapter 3 on Demand Forecast	
WAC 480-90-238(3)(b)	Plan includes an assessment of commercially available conservation, including load management.	See Chapter 4 on Demand Side Management including demand response section.	
WAC 480-90-238(3)(b)	Plan includes an assessment of currently employed and new policies and programs needed to obtain the conservation improvements.	See Chapter 4 and Appendix 4.1	
WAC 480-90-238(3)(c)	Plan includes an assessment of conventional and commercially available nonconventional gas supplies.	See Chapter 5 on Supply Side Resources	
WAC 480-90-238(3)(d)	Plan includes an assessment of opportunities for using company-owned or contracted storage.	See Chapter 5 on Supply Side Resources	
WAC 480-90-238(3)(e)	Plan includes an assessment of pipeline transmission capability and reliability and opportunities for additional pipeline transmission resources.	See Chapter 5 on Supply Side Resources	
WAC 480-90-238(3)(f)	Plan includes a comparative evaluation of the cost of natural gas purchasing strategies, storage options, delivery resources, and improvements in conservation using a consistent method to calculate cost-effectiveness.	See Chapter 5 on Supply Side Resources	
WAC 480-90-238(3)(g)	Plan includes at least a 10 year long-range planning horizon.	Our plan is a comprehensive 20 year plan.	
WAC 480-90-238(3)(g)	Demand forecasts and resource evaluations are integrated into the long range plan for resource acquisition.	Chapter 6 Integrated Resource Portfolio details how demand and supply come together to form the least cost/best risk portfolio.	
WAC 480-90-238(3)(h)	Plan includes a two-year action plan that implements the long range plan.	See Section 8 Action Plan	
WAC 480-90-238(3)(i)	Plan includes a progress report on the implementation of the previously filed plan.	See Section 8 Action Plan	
WAC 480-90-238(5)	Plan includes description of consultation with commission staff. (Description not required)	See Section 1 Introduction	
WAC 480-90-238(5)	Plan includes description of completion of work plan. (Description not required)	See Appendix 1.3	

## **APPENDIX 2.2**

### **COMMENTS AND RESPONSES TO 2009 DRAFT IRP**

## Appendix 2.2 Comments and Responses to 2009 DRAFT Integrated Resource Plan

The following table summarizes the significant comments on our DRAFT as submitted by TAC members and Avista’s responses. The planning environment in this IRP cycle was especially challenging given some of the most challenging economic volatility seen in decades coupled with industry changing dynamics in natural gas production. We responded with a more robust, flexible demand forecasting methodology that captured a broader range of demand forecasts fully vetted with our TAC. This IRP produced significantly reduced forecasted demand scenarios (primarily due to significantly lower actual demand since our previous IRP) and no near term resource needs even in our most robust demand scenario. We appreciate the time and effort invested by all our TAC members throughout the IRP process. Many good suggestions have been made and we have incorporated those that enhance the document or we believe could materially change the outcome of this IRP. Recognizing implementation cost/benefit tradeoffs and best use of resources, some suggestions have been deferred for consideration in future IRPs.

Document Reference <sup>1</sup>	Comment/Question	Avista Response
4.9	We are happy to see the increase of 25 percent in Washington and Idaho DSM targets, reducing demand by 2,193,338 therms in the first year (2010). We commend Avista for analyzing each measure separately for this plan. Even though it was more time consuming, it adds confidence to the results.	We are committed to pursuing this aggressive goal recognizing significant challenges exist to overcome tough economic conditions.
4.4	We prefer that an updated assessment of technical and achievable potential would have occurred for this IRP, but are glad to see plans to research and engage a conservation consultant to this analysis prior to the 2011 IRP. Since this current IRP is using a 2005 analysis for the base, it is timely and crucial to update the research for the next round.	An updated external assessment is planned for our next full IRP.

<sup>1</sup> All references are to the September 4<sup>th</sup> 2009 DRAFT IRP. NP means “not provided”. Some referencing has subsequently changed with respect to the FINAL IRP.

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
4.4	<p>Achievable potential is covered on page 4.4. We are concerned about the percentage of technical potential that is considered achievable in the North and South territories. In appendix 4.1, it states, “Avista’s achievable potential as a percentage of technical potential appears to be lower than other regional utilities”, and it explains a few reasons why it is different. We are not satisfied with the explanations. Cascade Natural Gas is using 75% achievable potential for natural gas. Analysis by the Energy Trust of Oregon shows up to 88%. We believe that Avista should consider in more detail why the larger gap between technical and achievable, and determine ways to close the gap. For example, is their technology penetration that may be underestimated? How is this overcome?</p>	<p>As stated in appendix 4.1, Avista acknowledges its achievable potential as a percentage of technical potential appears to be lower than other regional utilities. The methodologies employed by consultants can be quite different between utilities and cannot necessary be comparable on an apples to apples basis. We have agreed to engage a third party consultant prior to our next IRP to improve analysis and development of new baselines for technical potential for us.</p>
4.9	<p>Table 4.3 uses the terms acquirable and DSM goal, and it is not clear how these relate to technical versus achievable. We believe that the terms should be consistent if they are meant to be the same thing, or the terms should be clearly defined.</p>	<p>We have replaced all instances of acquirable with achievable as they are synonymous. DSM goal is slightly different reflecting a phase in of achievable therm savings. Glossary definitions for Technical, Achievable, and DSM goal have been clarified.</p>
4.8	<p>There is a footnote on page 4.8 that accompanies a statement on carbon adders to the price forecast of natural gas. It says, “Adder reflects price impacts to comply with anticipated climate change legislation. Section Two – Demand Forecasts has detailed discussion on our modeling of climate change policy.” This discussion is not found in Section Two or anywhere in the base document. Mr. Rahn directed me to Appendix 3.6 and 3.7, where the carbon adder and carbon adder discussion is found. We suggest that some explanation is included in the base document, or it is clearer, where the information can be found.</p>	<p>This was a drafting reference error and has been corrected to reference Appendix 3.6 and 3.7.</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
4.11	<p>DSM sensitivities are included on page 4.1.1. There is an analysis of accelerated and delayed DSM. The accelerated DSM is important because of increased awareness of energy efficiency nationally, accompanied with increased tax credits and incentives. We understand that resource shortages are not expected for many years; therefore it is not imperative to take this sensitivity to the next level and analyze the cost advantages of accelerated DSM in a scenario. Yet, to the extent that resources may be needed in the future, we believe Avista should consider accelerated DSM in alternate scenarios. Avista should continue to carefully watch for signs of either DSM sensitivity occurring and for signs that the demand for new resources should trigger an analysis of an accelerated DSM scenario.</p>	<p>Avista’s DSM team monitors actual trends relative to forecast as part of overall program evaluation. We will include monitoring and comparisons to the two alternate sensitivities considering their possible impacts on supply resource needs should they become more imminent.</p>
NP	<p>Although somewhat covered in your scenarios, It would be helpful to clearly illustrate benchmarks in the following areas and how you’ve arrived at them:</p> <p>a) quantifying the impacts of policy change (fracking and \$ per ton carbon legislation)</p>	<p>a) fracking was included in a TAC consensus estimate of broader drilling constraints potential cost adder of \$.30 (Drilling Constraints Sensitivity, Appendix 3.7). Carbon legislation impacts were captured in our two Carbon Mitigation sensitivities.</p>
NP	<p>b) recessionary demand (small commercial customers recovering at different rates)</p>	<p>b) for this IRP, we have not modeled demand at this level of granularity</p>
NP	<p>c) shale gas plays</p>	<p>c) impacts of shale gas production are captured in the consultant price forecasts</p>
NP	<p>d) currency valuation (US vs. Canada)</p>	<p>d) Our Canadian Imports Decline sensitivity (Appendix 3.7) considers a generalized escalated cost assumption to compete for higher priced imports whether it be from demand competition from oil sands, LNG exports, long term FX trends, or other price escalating factors.</p>
NP	<p>e) LNG Demand</p>	<p>e) impacts of LNG are captured in the consultant price forecasts</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
NP	f) new pipeline infrastructure (impact of connectivity)	g) impacts of pipeline infrastructure are captured in the consultant price forecasts
5.17	Under the “Supply Issues” section, you may include a timeline of when Avista estimates pertinent “Climate Change Policy” to occur.	We have added the following to the section: “Our Expected Case incorporates 2015 policy implementation in accordance with the Western Climate Initiative”.
5.17	In the same “Supply Issues” section, you may wish to include the impact of currency exchanges under “Supply from Canada”. Fiscal spending will eventually have an impact on inflation, how do you expect this to impact natural gas imports?	Our Canadian Imports Decline sensitivity (Appendix 3.7) considers a generalized escalated cost assumption to compete for higher priced imports whether it be demand competition from oil sands, LNG exports, long term FX trends, or other price escalating factors.
	When describing the “National pipeline infrastructure”, you may add a map of completed pipelines, pending pipelines, and a timeline of expected progress (given financial constraints) and impact on natural gas prices.	We were not able to find a suitable map for inclusion in this IRP prior to publication.
NP	More detail and clear positions on the conclusions drawn regarding issues of uncertainty is always helpful.	Comment noted.
1.2	“Avista uses the IRP process to develop two types of demand forecasts — annual average daily and peak day.” For the next IRP, add the following measures: seasonal annual average and regional/service areas averages.	Text edited to read “develop two primary types of demand forecasts”. These demand profiles as summarized here are derived from detailed daily, regional demand forecasts.
1.3	Peak Day Demand — “Coincidental peak day, system-wide core demand . . .” For the next IRP examine and include alternative definitions of peak demand.	In this plan we included an alternate Coldest Day in 20 years sensitivity analysis to ascertain effect on demand and incorporated into a scenario for resource analysis (Appendices 3.6 and 3.7).
1.3	Figure 1.1 demand growth NET of DSM. Commission wants to see demand growth without DSM and then a discussion of how much of growth is being met by EE.	Table added to Appendix showing gross demand, DSM savings, and Net Demand for Expected Case. Footnote added at 1.3 and 3.10 referencing the table.

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
2.6	<p>“We have also incorporated the Monte Carlo simulation module within SENDOUT® (formerly called VectorGas™), to simulate weather and price uncertainty.”</p> <p>For the next IRP, add demand uncertainty, resource availability uncertainty, and risk of non-performance.</p>	<p>Demand, resource availability, and non-performance risks are important risks we consider outside of the SENDOUT model. The Monte Carlo simulation module in SENDOUT only has specific functionality around statistically modeling weather and price uncertainty which is what we are highlighting in this statement.</p>
Figure 2.4	<p>This graph needs to cover at least 5 years, and 7 if possible. Otherwise the picture it presents is misleading.</p>	<p>We were merely illustrating the price movement during the most recent IRP planning cycle. We have added additional years with a band highlighting the most recent planning cycle.</p>
2.8 – 2.9	<p>Whenever there is a statement of summary of approach, objectives and commitment, please list the measures, steps, actions or criteria to meet these objectives, example: IRP PLANNING STRATEGY.</p>	<p>Comment noted.</p>
3.1	<p>Demand Forecast Methodology</p> <p>The methodology is overly limited. It’s time to include additional methods to forecast demand. Demand for natural gas has always been complex and difficult to predict and is growing more so every day. Avista should make changes to this assessment in the next IRP. It should include other available approaches that could be applied and are within the capabilities of Avista. The following should be considered:</p> <ol style="list-style-type: none"> <li>1. Prediction markets;</li> <li>2. Systems approaches;</li> <li>3. Game theory; and</li> <li>4. Behavioral economics.</li> </ol> <p>Delphi approaches might also be very useful as well as certain forms of data mining. Techniques developed by Economic/Financial Anthropology and Sociology should also be evaluated.</p>	<p>We believe our methodology is sound, cost effective and adequate for forecasting demand but are open to evaluating alternative demand forecasting methodologies in future IRPs. This IRP’s methodology was presented to STAFF for feedback in early 2009 and disclosed in our annual update. It was developed to encompass a wide range of demand forecasts by focusing on key demand drivers and varying assumptions. Numerous demand drivers and assumptions were explored with significant input from TAC members during our TAC meeting process.</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
3.2	<p>Demand Modeling Equation</p> <p>Weather and simple price are not the only factors effecting customer use of natural gas. Environmental concerns, pressure from community groups (e.g., political, religious, etc.), ethnic background, socioeconomic status, urban/rural location, occupation, etc. also effect usage.</p>	<p>The equations show the methodology and inputs used by the SENDOUT model, namely number of customers, weather and use per customer. We capture other considerations through use per customer coefficient adjustments as more fully explained later in Chapter 3 and in Appendix 3.6 &amp; 3.7 which was discussed with STAFF in March 2009 and extensively vetted with our TAC throughout the summer.</p>
3.2	<p>Number the "word equations" in these two tables so it's clear the second table is a detailed presentation of the first.</p>	<p>Numbering added.</p>
3.2	<p>Customer Forecasts</p> <p>Need to look at factors related to customers' choices about energy uses and the types of energy to use. These are not alone economic decisions. See above for other methods that could be applied to meet this goal.</p>	<p>We believe our methodology is sound and adequate for forecasting customer growth but are open to evaluating alternative demand forecasting methodologies in future IRPs.</p>
3.3	<p>"Forecasting customer growth is an inexact science so it is important to consider alternative forecasts. Two alternative forecasts were developed for consideration in this IRP. During the last 25 years, customer growth during five-year periods has ranged between one-half and one-and-a-half times the 25-year average customer growth rate. Since both patterns have been observed, Avista has created low and high customer growth alternatives with these parameters."</p> <p>This is wholly extrapolation based. Results need to be checked and assessed using other methods.</p>	<p>The alternative forecasts are reflective of and derived from our actual historical growth patterns seen over various periods. These forecasts develop a range of possible customer forecast outcomes that compares reasonably with detailed independent consultant population, household, employment and business growth forecasts we obtain and consider when preparing our forecasts (Appendix 3.1).</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
3.4	<p>“The first step in developing demand coefficients was gathering daily historical gas flow data for all of our city gates. Three years of data were gathered, segregated by service territory/temperature zone and then by month.”</p> <p>For reliable statistical analysis at least 5 years of data should be used. Three years is simply too small a sample unless we were to use techniques specifically for small samples, which are difficult to use and risky.</p>	<p>We performed extensive analysis on historical demand and development of predictive coefficients as part of our 2007 Action Plan (page 8.3, Demand Forecasting, second item). Our coefficients are derived from daily demand data representing over 90 data points for each monthly coefficient per sub region that derives a baseline use per customer (over 8000 data points total). These were checked through backcasting against actual demand in the most recent year. Older data has risks of diluting the most recent customer usage habits, DSM efforts, new customers, etc.</p>
3.4 and Figure 3.3	<p>“We then applied linear regression to the data to develop a linear relationship of usage to HDD.”</p> <p>This is obviously not a linear relationship. Non-linear regression would be best to use, but since that is complex and difficult to apply, I suggest using log-linear lines fitted either by trial and error, or just by eye.</p>	<p>Figure 3.3 shows twelve sets of data designated by color for each MONTHLY coefficient. Linear regression on these individual data sets produces very high R<sup>2</sup> in excess of .9 supporting a strong linear relationship (Appendix 3.3). The graphic was instructive in our TAC meeting when we discussed in detail our monthly coefficient development but we agree the graphic is confusing here and is removed.</p>
3.5	<p>“One inherent drawback to this methodology is the lack of sufficient data points to develop a strong linear relationship. More years of data can help, but the older data becomes less and less relevant to current demand relationships.”</p> <p>This is the strongest reason to find a nonlinear (if still using statistical approaches) alternative here.</p>	<p>Our challenge with consumption patterns in extreme temperatures is collecting sufficient, current data to determine a sufficiently predictive relationship. We are exploring using confidence intervals to quantify probabilities of consumption patterns under extreme temperature conditions for our next IRP.</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
5.8	<p>“Determining the appropriate level of firm transportation is a complex evaluation of many factors, including the projected number of firm customers and their expected annual and peak day demand, opportunities for future pipeline or storage expansions, and relative costs between pipelines and their upstream supplies. It is important to maintain an appropriate time cushion to allow for required lead times for securing new capacity. Also, the ability to release capacity offsets the cost of holding underutilized capacity.”</p> <p>A full transportation capacity needs study should be performed every 5 years or so to verify the levels and mix of pipeline capacity contracted for and its cost. When was the last such study performed by Avista? If not within the last 5 years, it should be completed as part of this IRP or the next IRP. Without a study, how has risk to meet demand been mitigated?</p>	<p>Our IRP analyses demand and the preferred resources to serve it. Transportation needs and resources are part of this analysis. This IRP indicates no near term resource needs for any of the range of demand forecasts modeled. Where existing capacity is not available for future needs, we utilize estimates for pipeline expansions as commissioning formal pipeline cost studies apply only to specific paths, are costly to perform, have limited shelf life, and are not binding commitments.</p>
5.13	<p>“In our modeling, we utilized available cost and other information to develop more generic pipeline resource alternatives rather than specifically modeling the various segments.”</p> <p>Specifically, what pipeline capacity modeling approach(es) was employed?</p>	<p>The region’s specific proposed pipelines do not provide full path deliverability to our service territories. In our model we input transport resources that assume full path deliverability while considering cost and other characteristics of the region’s proposed specific pipelines.</p>

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
5.13	<p>“To accurately assess costs and location feasibility of potential expansion scenarios requires detailed engineering studies by the pipelines. These studies can be expensive and of limited shelf life for projects that might be developed well into the future. Consequently, we employ estimates derived from our knowledge of historical costs, reasonable price escalations, and site specific issues that may impact a specific scenario. We combine this knowledge with past information from the pipelines to develop a reasonable basis for our transportation analysis.”</p> <p>See above comment on the need for a full and complete transportation needs and costs study every 5 years or so.</p>	<p>Our IRP serves as a transportation needs study which indicates no near term needs. Because of this, we are not advocating engaging a detailed cost study.</p>
6.1	<p>This chapter is too long primarily because it repeats many items and data from previous chapters. Please reduce this repetitiveness, use references more and less repeated explanations. Most importantly emphasize the integration process. How does SENDOUT examine and compare supply-side and demand-side resources on a comparable basis, if not a totally identical basis?</p>	<p>We have separated the information into two chapters encompassing our expected case and alternate scenarios/portfolios/stochastic analysis.</p>
6.2 (Figure 6.1)	<p>General comment – make sure figures are brought in at high enough resolution to be clear.</p>	<p>Acknowledged. Figure 6.1 presents challenges as it is an image extracted out of the SENDOUT software in bitmap format, a low resolution format. We have added a larger version of the figure at Appendix 6.5.</p>
6.29	<p>Place the tables in Appendix 6.9 somewhere around here and explain the choice among the portfolios clearly and concisely. Once completed it should be clear to the reader why the portfolio chosen was the best price, least risk selection in terms of Avista's criteria and the IRP guidelines. The cost criteria must be NPVRR, per the IRP guidelines. Similarly, portfolios not selected should be clearly and concisely explained so as to make it clear why they were not selected.</p>	<p>Summary information added to a new chapter indicating portfolios examined, portfolio selection, and NPVRR criteria used.</p>

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
Appendix – general comment	Make sure all pages are numbered	Page numbers added.
Appendix 3.7	How Avista’s budget constraints would limit DSM acquisition?	<p>Budget constraints aren’t necessarily the source of the limitation on Avista’s acquisition of DSM resources. However, the results of the SENDOUT model do not incorporate the aggregate infrastructure costs associated with major year-to-year changes in DSM infrastructure and strategy. Thus, when SENDOUT identifies the need for a <u>major</u> shift in the direction of our DSM resource acquisition, it must then be filtered through an implementation planning process that takes these previously unidentified costs into account. The result is a plan which will meet the long-term resource acquisition objectives identified by SENDOUT without unduly accelerating infrastructure costs.</p> <p>Examples of the improvements to the raw SENDOUT results might include the phasing in or out of incentives based upon market considerations, acceleration or deferral of certain programs to allow for coordination with non-Avista stakeholders (manufacturers, ETO, regional or national initiatives), shaping the ramp-up of acquisition to avoid inducing market shortages and increases in retail prices and constraining year-to-year increases in Avista DSM infrastructure to avoid increasing administrative or productivity costs due to excessively rapid growth.</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
Appendix 6.2	Projected Long-Term Cost of Capital -- Avista Utilities for Net Present Value Analysis Why is Avista using a cost of capital rate different from its authorized (current) cost of capital by OPUC for its NPVRR analysis? Is this an error?	There is no error. Consistent with past IRP's we utilize a blended rate reflecting all three jurisdictions using the most recent rates at the time of initiating our analysis.
Appendix 6.9	Move most if not all of Appendix 6.9 into the body of the IRP document. Label these tables as NPVRR if that is what they are, per the guidelines requirement. If these are not NPVRR calculations, please correct the table to reflect such.	Summary information added to a new chapter indicating portfolios examined, portfolio selection, and NPVRR criteria used.
Appendix 6.9	How is the diversity of a portfolio valued? Avista should consider developing a portfolio matrix with the NPVRR, ranking of diversity, ranking of risk and whatever else the company will inevitably subjectively use to choose a portfolio.	Each portfolio has varying assumptions around price, customer counts, weather, resource availability, etc. Portfolios are then compared and ranked based on the NPVRR as detailed in Appendix 6.9 and now summarized in a new chapter as per the response to the comment at document reference 6.1 above. Also, appendix 3.6 and 3.7 includes detailed descriptions of the assumptions of each portfolio.
4.11	DSM accelerated sensitivities are limited to Tax credits. There are other factors that can incite customers to pursue DSM measures such as higher commodity prices, high demand, weather, and revenue incentive mechanisms. Please include and discuss all factors that affect this scenario.	This was a specific TAC recommended scenario to address the potential impacts of then recently passed tax credits. We considered a host of use per customer adjustments including price elasticity and weather in our other sensitivities and scenarios analysis (Chapter 3 & Appendix 3.6, 3.7)

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
4.11	<p><u>DSM Delayed</u> Please explain the specific budget constraints influence customer incentives. Does the absence of a regulatory incentive mechanism such as decoupling or public purpose funding present a conflict for the company to promote energy efficiency and conservation?</p>	<p>Avista is committed to budgeting for the acquisition of cost-effective DSM resources. This can be a challenging era when rapid growth in DSM acquisition may be called for. It is our intent to be responsibly responsive to the changing DSM resource environment. This may include tempering our year-to-year response in consideration of the potential impacts upon infrastructure cost, coordination with other stakeholders and impacts upon retail markets for energy-efficiency goods and services.</p> <p>The opportunity for Avista to obtain full fixed cost recovery on measures implemented through the DSM program removes adverse shareholder impact upon increasing acquisition through the DSM portfolio. The Company continues to monitor mechanisms which provide for fixed cost recovery for decreases in usage.</p>
4.9	<p><u>Table 4.3:</u> The cumulative goal in the North Division increases from approximately 2.2 million therms in CY 2010 to 54.7 million therms in 2029, i.e. 27 times while it increases in the South Division by approximately 15 times. Given that Avista's independent study to identify potential energy savings was based on Oregon service territories and then extrapolated the methodology to the North Division, how did Avista base its projections for much higher savings in the North Division?</p>	<p>North Division includes a significant phase in whereas the South Division uses a modest phase in (Figures 4.4, 4.5). Using the Cumulative Potential results in a generally comparable relationship of approximately 17 and 14 times for North and South Divisions, respectively. Also, the colder temperature of the North Division inherently facilitates increased therm savings for weather sensitive measures.</p>

<b>Document Reference<sup>1</sup></b>	<b>Comment/Question</b>	<b>Avista Response</b>
Appendix 4.2	<p>Please explain why measures with the same description are listed multiple times. Also explain why the savings are different.</p> <p>Several measures as Duct sealing (#21), high efficiency water heater (#50), Tankless Water Heaters (#66) show very significant technical savings. How does Avista plan to identify and take steps to increase the acquirable savings since these measures could achieve significant results?</p>	<p>A column was omitted in error from the published table which delineates customer type such as single family residential, multifamily residential, mobile home, etc. The table has been updated to include the customer type information.</p> <p>Appendix 4.1 discusses the errors encountered with technical potential in our most recent external study. An updated external assessment is planned for our next full IRP.</p>
Action Plan 8.5	<p>With regard to monitoring commodity, storage and supply resources, has the economy rebounding sooner rather than later been taken into consideration in the associated results?</p>	<p>Yes. Our high growth scenario considers a robust economic recovery while recognizing significant supply capacity exists from previous dramatic production cuts.</p>
Action Plan 8.7	<p>Avista included analysis of realistic alternative world situations in which Avista may have to operate during the next 20 years, particularly in light of current, new and proposed state, federal and Canadian energy policies and the ongoing evolution of North American and world natural gas, oil and coal markets, in its action plan as required in the acknowledgement of its last IRP. The need of additional action items for this IRP has not been determined at this point.</p>	<p>We cannot address potential additional recommended action items until they are known.</p>

Document Reference <sup>1</sup>	Comment/Question	Avista Response
4.7	<p>What is the logic behind the adjustment for non-residential program duplication on page 4.7 in Table 4.2? The description in the text says it is an adjustment for site-specific programs and the measures accepted in SENDOUT, but the non-residential program number in the table is only 75,601. Please explain.</p>	<p>Table 4.2 summarizes the achievable potential by customer type (residential and non-residential). For non-residential, individual prescriptive measures are entered into SENDOUT but the customized nature of site specific acquisition requires estimation. The 811,920 therms (for 2010) is the estimated total gross technical potential for site specific bundled programs which <b>includes</b> certain prescriptive measures included in the bundle. The estimated technical potential for the prescriptive measures (on a standalone basis) included in the 810,920 therm estimate is 685,440 therms which is conceptually already captured in the technical and achievable potential for the individual prescriptive measures entered into SENDOUT and therefore needs to be netted out to avoid double counting. The net amount of 126,480 therms is the estimated net non-residential, non-prescriptive therm savings, essentially the highly customized measures which are not able to be standardized and input into SENDOUT.</p> <p>The 75,601 Dth represents the achievable potential of the individual non-residential prescriptive measures that were entered, tested and selected in SENDOUT.</p>

**APPENDIX 3.1**

**CUSTOMER FORECASTS**

## APPENDIX 3.1 – CUSTOMER FORECASTS

### OVERVIEW

Avista presented their 2009 Natural Gas Demand Forecast to the Technical Advisory Committee (TAC) in April 2009. What follows in narrative is the process of preparing the base customer growth forecast. The first step is a framework forecast of the national economy, followed by regional economic forecasts consistent with the national outlook. The employment and population forecasts are the key drivers for the natural gas customer forecast.

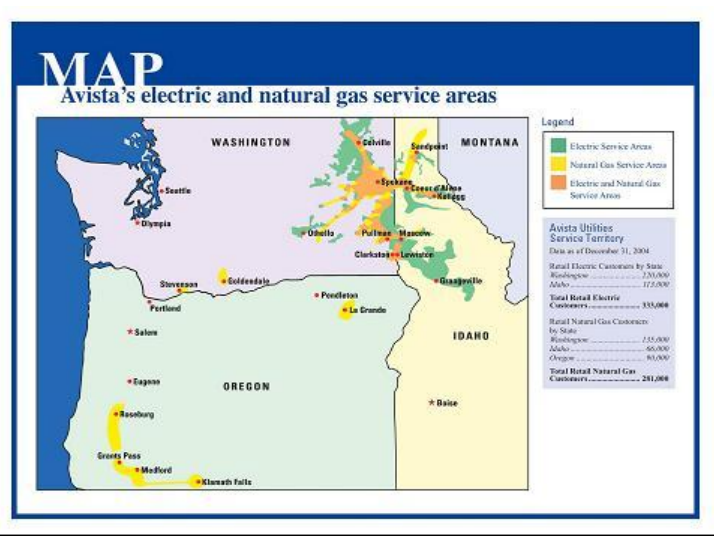

### NATIONAL ECONOMIC OUTLOOK

Avista has contracted for national economic forecasts with Global Insight, Inc. for over two decades. The Spring 2008 twenty-five year long term forecast was used as the basis for the 2009 effort; the Spring 2009 county forecast update took into account the depth of the current recession but was largely unchanged after the anticipated economic recovery. The following narrative has Avista remarks and Global Insight forecasts (used with permission) which are consistent with the presentation at the TAC in April 2009, with a focus on the near term national outlook.

The U.S. Gross Domestic Product is expected to rebound to levels in 2010 to the 2.5 to 3.0 percent range after the severe recession in 2008 and 2009. Longer term the rate settles in at 2.6 percent.

### REGIONAL ECONOMIC OUTLOOK

Avista serves natural gas in eastern Washington, northern Idaho, and in portions of five counties in Oregon. The principal county in Washington is Spokane, while in Idaho there are two counties; Kootenai and Bonner are barometers of service area growth. Kootenai County includes Coeur d’Alene, Post Falls, Hayden and a host of smaller municipalities and Bonner County is anchored by Sandpoint. The primary cities in Spokane County are the City of Spokane, City of Spokane Valley and Liberty Lake. In Oregon, the counties (principal city) of Jackson (Medford), Josephine (Grants Pass), Douglas (Roseburg), Klamath (Klamath Falls) and Union (La Grande) round out the service territory. The map below shows the breadth of the service area.

Global Insight, Inc. has been providing county-level forecasts to Avista for several years. These forecasts are consistent with and driven by their national forecast.

The economic concepts provided are forecast forward for 30 years. We report below forecast data ending in the year 2030, the twenty-year horizon IRP horizon.

Overall, the results of the economic forecasts suggest the following impacts on Avista’s customer growth: Near term the weakness in construction will be mirrored with slow customer growth, while longer term, underlying employment and population growth will drive customer growth.

The following table indicates a listing of 21 counties served with natural gas by Avista. We purchased economic forecasts for the 15 principal counties.

<b>Table of Counties Served (All or Portions)</b>		
<b>Washington</b>	<b>Idaho</b>	<b>Oregon</b>
Adams*	Benewah	Douglas
Asotin	Bonner	Jackson
Franklin*	Boundary	Josephine
Grant*	Latah	Klamath
Klickitat*	Nez Perce	Union
Lincoln*	Shosone	
Skamania*		
Spokane		
Stevens		
Whitman		
*Did not purchase economic data, few customers served		

The charts that follow are the actual employment, population, population age 65 and over, number of households and personal income forecasts used to produce the natural gas customer forecasts by state, by customer class (residential, commercial and industrial) and by rate schedule (firm – small, medium and large-sized customers).

Although the forecasts are prepared in detail by county, the charts aggregate the data by State.

The first pair of charts is Non-Farm Employment. During the last decade, fairly consistent growth in jobs was observed except during recession periods in 2000-01 and at the present time.

The twenty year average compounded growth rate in jobs for Idaho Counties was 2.6 percent from 1990-2010, and is forecast to be 2.1 percent for the period 2010-2030. Washington Counties were 1.7 percent from 1990-2010, and is forecast to be 1.4 percent for the period 2010-2030. And Oregon Counties were 0.9 percent from 1990-2010, and is forecast to be 1.2 percent for the period 2010-2030.

Next is resident population. The twenty year average compounded growth rate in population for Idaho Counties was 2.2 percent from 1990-2010, and is forecast to be 1.5 percent for the period 2010-2030. Washington Counties were 1.3 percent from 1990-2010, and is forecast to be 1.0 percent for the period 2010-2030. And Oregon Counties were 1.1 percent from 1990-2010, and is forecast to be 1.0 percent for the period 2010-2030.

The next pair of charts is persons 65 years and over. The twenty year average compounded growth rate in persons 65 and over for Idaho Counties was 3.1 percent from 1990-2010, and is forecast to be 3.1 percent for the period 2010-2030. Washington Counties were 1.8 percent from 1990-2010, and is forecast to be 2.9 percent for the period 2010-2030. And Oregon Counties were 2.4 percent from 1990-2010, and is forecast to be 2.8 percent for the period 2010-2030.

The next economic variable used in the preparation of Avista’s forecast is number of resident households in the service area. The household growth rate for Idaho Counties was 2.6 percent from 1990-2010, and is forecast to be 1.6 percent for the period 2010-2030. Washington Counties were 1.4 percent from 1990-2010, and is forecast to be 1.1 percent for the period 2010-2030. And Oregon Counties were 1.5 percent from 1990-2010, and is forecast to be 1.2 percent for the period 2010-2030.

---

## REFERENCE CASE FORECASTS OF CUSTOMERS SERVED

Reference case customer forecasts for residential customers are consistent with our economic forecasts. The relationship has been changing over the last decade, and the forecasts take into account the most recent trends. As shown on the next figure, the number of residential customers per household grew rapidly between 1997 and 2001, while it has slowed during the present economic downturn. About half of the growth between 1997 and 2001 was due to fuel switching of existing homes from other heating sources to natural gas. Although fuel switching continues to occur, today it represents only 15 percent of customer additions.

To produce the customer forecast, we look at recent trends in housing construction and the likelihood those homes will be served with natural gas. For example, in Washington, the number of single family homes being constructed has declined, with apartment dwellings taking a larger market share. Multi-family housing has traditionally been served with electricity only, limiting the number of available dwellings for natural gas service.

However, in the areas outside of the urban core of Spokane, including the rest of Washington, much of Idaho and Oregon, housing construction activity has maintained very high levels of single family homes, whether detached-style homes on individual lots or attached-style homes, like duplexes, townhomes, or condominiums. This market is traditionally served with natural gas water and space heat, and many of these homes now are being built with natural gas clothes dryers, gas ranges and ovens and natural gas fire places.

Because growth management laws are in place in all of Avista's natural gas service areas, we assume these construction trends in the urban growth areas will be served with natural gas, and do not anticipate any switching to electricity. We have an effort under way to encourage multi-family builders, who typically are building apartments for rental purposes, to include natural gas appliances, but this forecast does not assume this effort will lead to a change in construction practices. We will continue to monitor activity in the multi-family housing segment.

The forecast assumes that the trends of the last five years continue into the future, adjusted for the sharp building cycle presently under way and based on the household forecasts provided by Global Insight. The next chart shows the number of residential customers per household. The reason this ratio is increasing in the forecast period is because the ratio of homes being added is higher than the current ratio. This is largely driven by the assumption of nearly 100 percent of new homes having at least one natural gas service. Also, outside of the Medford and Spokane metropolitan areas, the multi-family construction market is very small. The only exception would be in Pullman and Moscow where growth in university enrollments is leading to apartment construction activity in those special areas. To a lesser extent, La Grande, Klamath Falls, and Ashland are seeing student growth-driven apartment construction, but to a small extent.

The residential customer forecast is the product of the customers-per-household forecast and the household forecast from Global Insight.

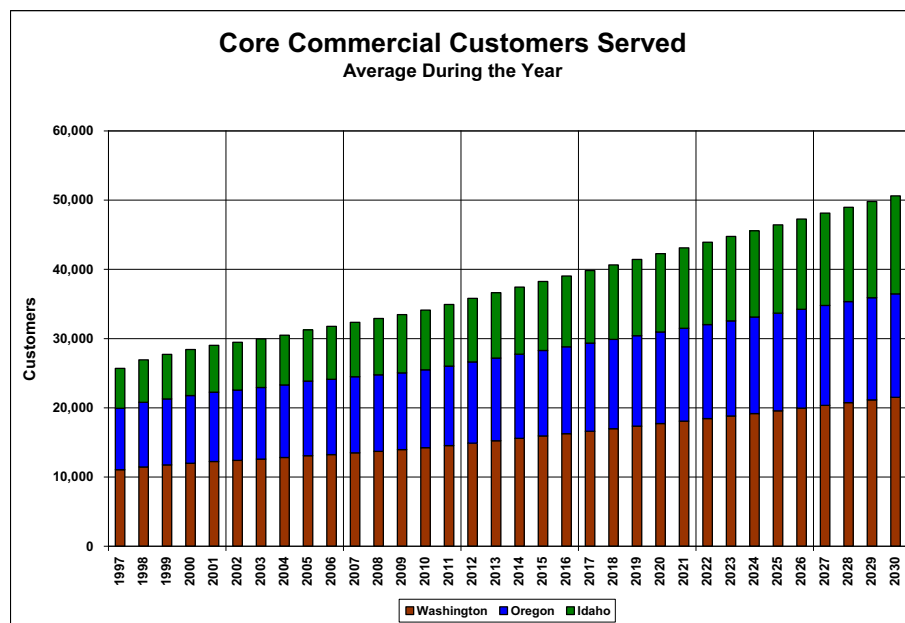

Core commercial customers served are based on job forecasts for each county, as well as the number of residential customers. The figure below shows ratio of non-farm workers per commercial customer. The previous ten years show declines in numbers of workers early in the period, followed by a buildup until recently. This build up is due to an increase in the number of big-box retail stores, which have moved from the very large metro areas into the smaller metro areas served by Avista. We believe that build out is largely complete. We do not anticipate new large mall-type complexes will be built in to any great extent. Therefore, in a few more years we expect the number of workers will again begin to decline as smaller shops and strip-mall developments fill into the neighborhood developments. We have taken into account the known shopping areas that have been either permitted or have a high probability of being built in the near term forecast. As

shown in the chart, although declines are forecast, they are very modest and reflect the particular characteristics of the existing mix of commercial developments in each state.

The commercial customer forecast is based on job forecasts multiplied times the forecasted ratio of workers per customer as described above.

Core industrial customers served are based on manufacturing job forecasts for each county. The number of manufacturing workers is expected to be growing slowly over the forecast period, leading to little change in the number of core firm industrial customers.

## **APPENDIX 3.5**

### **GLOBAL WARMING SUMMARY AND GRAPHS**

# Global Warming

- Peak and trough weather appears more volatile
- Reduce annual consumption over time
- Decrease **non peak HDDs** over time to reflect warming trend

## GLOBAL WARMING ADJUSTMENT

- Heating degree day data is obtained from the National Weather Service (NWS). Avista uses the most recent 30-year period, which goes from 1979-2008. For Oregon, Avista uses four weather stations as the weather basis, corresponding to the areas within which natural gas services are provided, all of which are official National Weather Service stations. Heating degree day weather patterns between these areas are uncorrelated.
- At the April 2009 Technical Advisory Committee meeting, Avista presented some data and information regarding trends in heating degree days for its service area. Avista has adopted a “Global Warming” baseline for forecasting which captures the modest warming trend (i.e. gradually declining heating degree days) expected through the 20 year forecast period.
- By 2030, as compared to the “official” NWS normal figures based on the 1971 -2000 period, the number of annual heating degree days as a percentage of the official period are:
  - Spokane 93.9%
  - Medford 88.4%
  - Roseburg 86.8%
  - Klamath Falls 94.9%
  - La Grande 81.6%

## **APPENDIX 3.7**

### **ALTERNATE DEMAND SCENARIOS DESCRIPTIONS**

## Appendix 3.7

# Avista 2009 Natural Gas IRP Demand Forecast Sensitivities and Scenarios Update

### A. Definitions

**Dynamic Demand Methodology** – Avista’s demand forecasting approach wherein we 1) identify key demand drivers behind natural gas consumption, 2) perform sensitivity analysis on each demand driver, and 3) combine demand drivers under various scenarios to develop alternative potential outcomes for forecasted demand.

**Demand Influencing Factors** – Factors that directly influence the volume of natural gas consumed by our core customers.

**Price Influencing Factors** – Factors that, through price elasticity response, indirectly influence the volume of natural gas consumed by our core customers.

**Reference Case** – A baseline point of reference that captures the basic inputs for determining a demand forecast in SENDOUT which includes number of customers, use per customer, daily weather temperatures and natural gas prices.

**Sensitivities** – Focused analysis of a specific natural gas demand driver and its impact on forecasted demand relative to the Reference Case when underlying input assumptions are modified.

**Scenarios** – Combination of natural gas demand drivers that make up a demand forecast.

### B. Reference Case Input Assumptions

Customer growth rates reflect roll up of underlying county level growth rate analysis utilizing Global Insights forecast data (see **Tables & Graphs**, *Figure 1* below). Initial use per customer is based on historical analysis of last three years data. Peak Day weather reflects coldest average daily temperature experienced over available weather data. Natural gas price curve derived from independent consultant forecast (Wood Mackenzie, an industry information & analysis consultant) with first five years modified to include blend of recent market prices (Nymex forward prices). The resulting real price forecast (2009\$) is included in *Figure 2*.

## C. Sensitivities

The following Sensitivities were performed on identified demand drivers against the reference case for consideration in Scenario development. Note that Sensitivity assumptions reflect incremental adjustments we estimate are not captured in the underlying reference case forecast.

**Low & High Customer Growth** – In our low customer growth Sensitivity, annual customer growth rates under perform the reference rate of growth by 50% over our 20 year planning horizon while annual customer growth rates exceed the reference rate by 50% in our high growth Sensitivity (*Figure 1*).

**Coldest Day 20yrs Weather Standard** – Peak Day weather temperature reduced to coldest average daily temperature (HDDs) experienced in the most recent 20 years in each region. Note this sensitivity only affects our WA/ID, Medford and Roseburg service regions as Klamath Falls and La Grande have experienced a coldest day on record within the last 20 years.

**Low & High Prices** – To capture a wide band of alternative prices forecasts, we use the Northwest Power and Conservation Council’s “very low” and “very high” natural gas price forecast scenarios with first five years modified to include blend of recent market prices (Nymex forward prices) consistent with our Expected price forecast (*Figure 2*).

**Expected, Low, and High Elasticity** – For our expected elasticity Sensitivity, we incorporate reduced consumption in response to higher natural gas prices utilizing a price elasticity study prepared by the American Gas Association. We then consider a lower response rate to the study as well as a higher response. We also consider a wider band of response in especially volatile prices defined as annual price increases exceeding 30% (*Figure 3*).

**Carbon Mitigation 1** – Utilizes carbon cost adders quantified by independent analysis from Wood Mackenzie. They identify both an adder reflecting carbon allowances as well as an adder to capture the effect of increased natural gas demand as more gas turbines come online to replace coal plants and back up wind generation. The allowance adder escalates from \$5/ton in 2012 to \$67/ton by 2030 while the increased demand adder climbs from \$.50/mmbtu to \$1.00 over our planning horizon (*Figure 4*).

**Carbon Mitigation 2** – Recognizing significant uncertainty exists regarding the amount, scope, and timing of carbon regulation, we utilize a second alternate range of cost adders to develop a high carbon cost case. We escalate an allowance adder from \$37/ton in 2012 to \$140/ton by 2030 as forecasted in a Pacific Northwest electric utility’s integrated resource plan. The increased demand adder is consistent with our **Carbon Mitigation 1** case.

**Canadian Imports Decline** – Beginning in 2015, we apply an estimate of \$.20/mmbtu *incremental* adder each year to regional natural gas prices to capture upward price

pressure because of decreased Canadian imports more severe than generally anticipated. The cumulative cost added by the end of our planning horizon is \$3.00/mmbtu. After discussion with the TAC, we dropped further analysis of our initial most severe imports decline case of \$.50/mmbtu incremental each year as we concluded this type of price increase would support several supply responses (including frontier gas pipelines) which would curtail such a long term price increase.

**Drilling Constraints** – This price adder estimates the impact from increased costs to comply with potential increased environmental regulations. Significant uncertainty exists regarding potential costs, impacts on production and timing of more stringent regulation. Also, it is very difficult to ascertain to what degree these types of costs are already captured in forward market prices and various price forecasts. In light of this challenge, we have assumed a \$.30/mmbtu adder in each year from 2012 to 2030 for this Sensitivity recognizing the wide range of actual outcomes.

\*\*\*\*\*

Following are other Sensitivities we evaluated:

**Compressed Natural Gas (CNG) Vehicles** – CNG vehicles assumed to produce a 15% cumulative incremental demand over our 20 year planning horizon. Our assumption utilized market consumption estimates from an independent analysis on CNG vehicle viability. The analysis indicates significant challenges exist to widespread adoption but did provide a scenario for significant market penetration (10% in 10 years). Although we concur significant system demand from CNG vehicle purchases in our service territories is unlikely at this time, we were motivated to run this sensitivity to learn how our system would respond to an emerging application that would grow significant new natural gas demand. This sensitivity, although instructive on understanding underlying incremental change in demand, is not currently used in any Scenario.

**1HDD Lower Weather Standard** – Peak Day weather temperature is reduced by 1 heating degree (Fahrenheit) in each service region. This sensitivity, although instructive on understanding underlying incremental change in demand, is not used in any Scenario.

**Northern Migration** – Economic and water issues in south western states spur increased migration to Pacific Northwest states. After discussion, it was determined that the **High Customer Growth** sensitivity would likely encompass this sensitivity's demand impacts therefore we did not pursue further analysis.

**Stagnant Growth** – Current economic conditions spur much slower and possibly negative customer growth rates for an extended period with a return to trend rates at some point. It was noted that we have not experienced widespread negative growth in our actual recent data. Our significant residential customer base has historically been very stable and not prone to extreme boom or bust cycles in four of our five service regions. Medford/Roseburg would appear most vulnerable to a severe impact though a sustained negative growth trend appears remote. Also noted were the very low long term growth

rates in our **Low Customer Growth** sensitivity. After discussion, it was determined that the **Low Customer Growth** sensitivity would likely encompass this sensitivity's demand impacts therefore we did not pursue further analysis.

**Global Warming** – Adjust the regional peak day weather temperatures lower to account for global warming. Although we have developed analysis supporting adjustment to historical average daily temperatures for our forecasted average daily temperatures, we searched unsuccessfully for information that would provide a basis for adjusting peak day temperatures. Our data does suggest more volatile temperatures recently but is inconclusive on a trend of lower (or higher) peak temperatures. One TAC member provided information from a study that could not conclude global warming influenced peak day temperatures. Another TAC member offered reliable assessments of global warming applied to specific service regions would be challenging given local weather dynamics and conjectured overall global warming weather dynamics might produce possible peak day cooling trends for regions situated in transition areas. After discussion and feedback, we determined that a reliable basis for global warming temperature adjustment is too uncertain. We also believe the **Alternate Weather Standard** sensitivity may encompass many possible demand impacts for this sensitivity therefore we did not pursue further analysis.

\*\*\*\*\*

The following two DSM Sensitivities were also conducted:

**DSM Accelerated** – Federal stimulus funded residential audit programs and tax credits in combination with our program rebates induce increased conservation in 2010 beyond what is assumed in the IRP base case.

**DSM Delayed** – A combination of reduced customer disposable income from the economic recession and a freeze in customer incentives due to Avista budget constraints result in a reduction in energy-efficiency measures from what is assumed in the IRP base case.

## D. Scenarios

After identifying the above demand drivers and analyzing the various Sensitivities, we have developed the following demand forecast Scenarios:

**Expected Case** – This Scenario we believe represents the most likely demand forecast modeled. We assume service territory customer growth rates consistent with the reference case, a weather standard of coldest day on record in each service territory, our middle range natural gas price forecast (Consultant #1), low price elasticity, and the CO2 cost adders from our **Carbon Mitigation 1 (CM1)** Sensitivity. The Scenario does not include incremental cost adders for declining Canadian imports or drilling restrictions beyond what is incorporated in the selected price forecast.

**High Growth, Low Price** – This Scenario models a rapid return to robust growth in part spurred on by low energy prices. We assume customer growth rates 50% higher than the reference case, coldest day on record weather standard, our low natural gas price forecast, low price elasticity, and CO2 adders from **CM1**. The Scenario does not include incremental cost adders for declining Canadian imports or drilling restrictions beyond what is incorporated in the selected price forecast.

**Low Growth, High Price** – This Scenario models an extended period of slow economic growth in part resulting from high energy prices. We assume customer growth rates 50% lower than the reference case, coldest day on record weather standard, our high natural gas price forecast, high price elasticity, and CO2 adders from our **Carbon Mitigation 1 Sensitivity (CM1)**. The Scenario also includes a incremental cost adder for drilling restrictions.

**Green Future** – This Scenario models a moderate return to economic growth consistent with our Expected Case while striving for environmentally friendly objectives. We assume service territory customer growth rates consistent with the reference case, a weather standard of coldest day on record in each service territory, and our middle range natural gas price forecast but with price adjustments including the CO2 cost adders from **CM2**, and drilling restrictions. We also assume our high elasticity response to rising prices.

**Alternate Weather Standard** – This Scenario models all the same assumptions as the **Expected Case** Scenario except for the change in the weather planning standard from coldest day on record to coldest day in 20 years for each service territory. As noted in the Sensitivity analysis, this change does not affect the Klamath Falls and La Grande service territories which have each experienced their coldest day on record within the last 20 years.

**Supply Constraints** – This Scenario models an extended period of slow economic growth in part resulting from high energy prices. We assume customer growth rates 50% lower than the reference case, coldest day on record weather standard, our high natural gas price forecast, medium price elasticity, and CO2 adders from our **Carbon Mitigation 1 Sensitivity (CM1)**. The Scenario also includes incremental cost adders for declining Canadian imports and drilling restrictions.

## E. Tables & Graphs

Figure 1 – Customer Growth Rates

Customer Growth Rates		Reference Case	Low Cust Growth	High Cust Growth
Residential	WA/ID	2.2%		
Residential	Medford	2.6%		
Residential	Roseburg	3.6%		
Residential	Klamath	1.9%	50% Decrease in Cust Growth Rates	50% Increase in Cust Growth Rates
Residential	La Grande	1.4%		
Commercial	WA/ID	2.3%		
Commercial	Medford	1.2%		
Commercial	Roseburg	2.1%		
Commercial	Klamath	1.9%		
Commercial	La Grande	0.6%		

Figure 2 – Henry Hub Natural Gas Price Forecasts (2009\$)

Figure 3 – Price Elasticity Factors

	Real Price annual increase within 30%	Real Price annual increase exceeds 30%
High	Negative .20	Negative .30
Expected	Negative .13	Negative .13
Low	No response	Negative .10

## **APPENDIX 4.1**

### **DSM IMPLEMENTATION AND OPERATIONS**

## **APPENDIX 4.1 – DSM IMPLEMENTATION & OPERATIONS**

---

### **AVISTA DSM COMMITMENT**

Avista recognizes our obligation to meet the resource needs of customers in the most cost-effective manner. The delivery of conservation programs is anticipated to represent an increasing portion of the optimal resource portfolio. The IRP process is an opportunity to comprehensively review the conservation program portfolio and make necessary revisions to daily DSM operations and longer-term implementation plans in order to meet those commitments in the years to follow.

This document summarizes a broad evaluation of applicable conservation measures and identifies those worthy of testing against all other supply-side resources to assist us in making decisions about which measures would be suitable to carry forward into program development and implementation.

Through our TAC process we solicited comments from key stakeholders regarding the selection, characterization and testing of conservation measures within the IRP process. After much discussion and some revision, the general consensus of those stakeholders was that this approach was sufficient to represent conservation opportunities within the IRP.

There are concerns about our South Division due to the economic condition and high levels of unemployment that could constrain participation. We remain open to alternative approaches to overcoming those market barriers to include enhanced outreach efforts, revised incentives, and innovative marketing of conservation programs and cooperative arrangements with other agents in the market, with particular attention to other natural gas utilities, the Energy Trust of Oregon and regional market transformation efforts with an interest in natural gas efficiency.

Additionally, we are committed to maintaining a collaborative relationship with all stakeholders who may contribute to the improvement of DSM efforts as programs are further developed and launched. We continue to improve the management of these programs through development of additional metrics, improved reporting and benchmarking for determining the regulatory prudence of these programs.

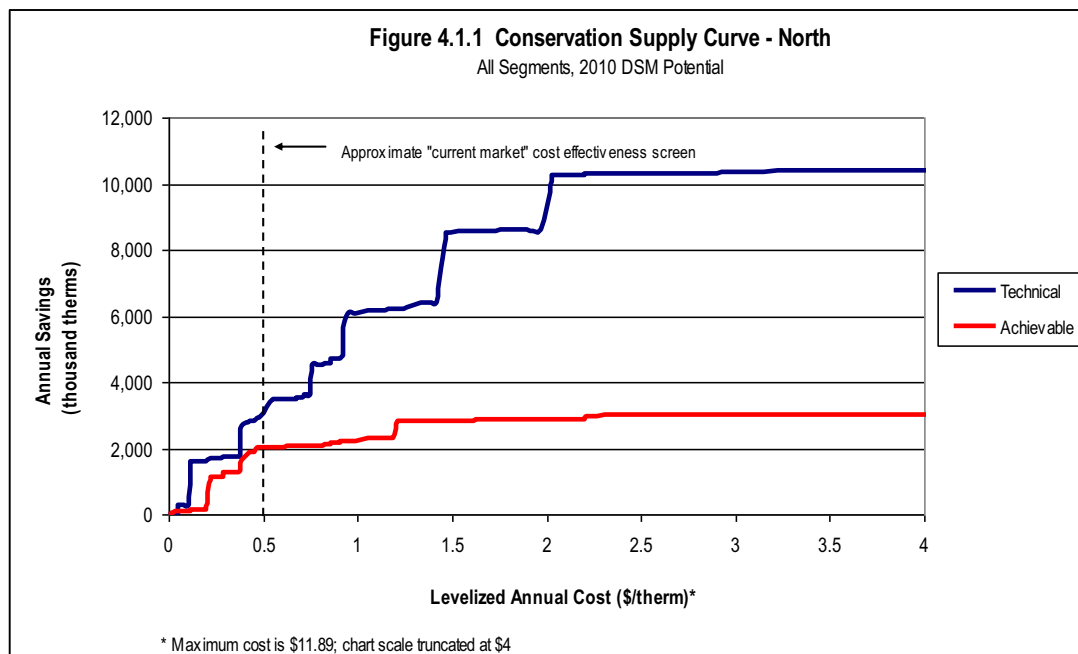

Avista recognizes that acquiring all cost-effective conservation potential is not limited by the therm acquisition goals established in this IRP. The implementation of the results of this planning will be sufficiently flexible to realize opportunities even if they are well in excess of expectations. Human and financial resources will be made available to the extent necessary to achieve the cost-effective potential without regard to those goals.

### **TECHNICAL AND ACHIEVABLE POTENTIAL**

In 2005, Avista contracted with RLW Analytics, a conservation consultant, to independently identify and analyze the potential energy savings for our Oregon service territories. The methodology from this study was extrapolated to Washington and Idaho and served as the initial basis for determining

conservation technical potential for all of Avista’s natural gas service territories. The energy savings data for weather-sensitive measures were adjusted to incorporate local HDD data appropriate to each geographic area. Avista DSM engineers, program implementers and analysts also reviewed the RLW estimates of incremental measure costs, measure lives, energy savings, and other inputs and assumptions making adjustments when knowledge of local factors differed from the more generalized assumptions used in the study. Since 2005, we have made adjustments and updates to incorporate new information regarding measure cost and energy savings, and have augmented the study with additional measures not previously evaluated.

Figures 4.1.1 and 4.1.2 depict supply curves for technical and achievable potential for our North and South divisions.

Avista’s achievable potential as a percentage of technical potential appears to be lower than other regional utilities. However, our actual per customer savings acquired compare favorably with other regional utilities. Unlike other regional utilities that have selected an overall percentage of their technical potential to estimate achievable potential, Avista analyzes each measure’s likely installation rate to establish measure by measure achievable potential. Engineers and program implementers begin their evaluation with the number of customers in a division broken down by the estimated percentage that is single family, multifamily or manufactured homes. The applications are evaluated based on how many have or could have access to an application in their home or facility and, finally, how many applications would be replaced with a higher efficiency option over the standard option over the twenty year horizon. This methodology used to develop achievable potential tracks with our actual results and is comparable with other regional utilities.

For perspective, we indicate a cost effectiveness screen of \$0.50 per therm based on an approximate current market commodity cost of \$5 per Dth. Around this level, Avista’s achievable potential tracks much closer with the technical potential and is similar to other regional utilities.

We have tried to identify differences that create the large gap between our achievable potential and RLW’s technical potential. We did not identify every difference but we did make changes to technical potential that we could support and document. Some examples were:

- The pre-rinse sprayer program was a one-time, non-recurring, non-residential program where Avista pursued installations of sprayers in all existing applications. Since these sprayers are now code, the savings will not recur. Therefore, we removed savings associated with pre-rinse sprayers from the RLW technical potential.
- The same technical potential was listed for all water heater applications, so it appears that RLW failed to consider the mutually exclusivity of the various types of water heaters. A

---

single-family residential customer typically only has one water heater application in their home. However, RLW included that same customer in the technical potential for tanked, tankless, and passive solar water heaters. We think this same issue may exist for other measures but we could not verify this, so an adjustment was made only to the water heaters technical potential.

- In the past, Oregon Staff has generally disapproved faucet aerators and low-flow showerheads as viable measures with demonstrable savings, so we removed the savings associated with these two measures.
- RLW included nearly 3,000 units of thermal vent dampers in a multi-family application. Based on our market knowledge, we felt this number of the entire population was overestimated and was more realistic at 1,000 units. This resulted in a decrease in technical potential of 54,000 therms.

While this is not a complete list of potential differences with RLW's estimate of technical potential, this concern should be resolved with a new external study of technical potential which we intend to pursue prior to completion of the 2011 IRP.

The following sections discuss Avista's DSM programs and how the IRP results are incorporated into DSM operations.

## **SOUTH DIVISION DSM PORTFOLIO**

Avista's residential measures are available to approximately 84,000 customers (Avista Rate Schedule 410) with an annual consumption of 50.5 million therms. The commercial measures are available to nearly 11,200 mostly small-to-medium-sized customers (Avista Rate Schedules 420 and 424) with an annual consumption of approximately 32.3 million therms. The largest segment of qualified non-residential customers use natural gas for space, water heating and cooking with an average consumption of nearly 2,900 therms each.

The measures offer a mix of both currently cost effective and market transformation measures which are expected to be cost-effective over time. The combined residential and non-residential therm goal for 2010 is 326,314 and 324,314 for 2011. Details on individual measures such as measure life, levelized TRC, unit goal, and therm goal can be found in Appendix 4.2.

### **RESIDENTIAL SEGMENT**

Avista's residential program consists of site specific and prescriptive measures and includes a mix of currently cost effective measures and market transformation measures which are expected to be cost-effective. The 2010 residential therm goal is 215,580 and 206,333 in 2011.

Avista's residential site specific program is primarily focused on cost effective shell measures. Changes made to the program in early 2007 include: higher incentive levels, removal of all non cost effective measures and requiring window upgrades to be included with at least one other major

---

measure. We will consider additional enhancements as they are identified to increase program participation.

We also offer prescriptive incentives such as tankless water heaters, high-efficiency direct vent space heaters, external chimney dampers, programmable thermostats, high efficiency forced air furnaces and high efficiency tank water heaters.

In the majority of cases, tank water heaters are replaced on “burn out” with the high efficiency models costing, on average, \$120 more than standard efficiency models. Product availability has gotten better, but continues to be an issue going forward. We believe that to affect the incremental cost and maintain availability, that high efficiency tank water heaters should be retained as a “market transformation” program in 2010 and 2011.

We also believe building a strong trade ally network is the best way to promote the acceptance of higher efficiency equipment. Our trade allies currently include HVAC dealers, plumbers, retailers, manufacturers, distributors along with builders and developers. Avista has also established relationships with groups such as the home builders association and landlord associations throughout its service territory.

### **NON-RESIDENTIAL SEGMENT**

Prior to 2007, our non-residential measures were site-specific offerings only. In early 2007, Avista added several cost effective prescriptive measures such as high-efficiency space heating equipment, Energy Star gas fryers, Energy Star three pan gas steam cookers and high-efficiency gas rack ovens.

The non-residential therm acquisition goal for 2010 is 110,734 and 118,650 for 2011. Avista also expects to add new prescriptive measures in 2009. Measures being considered include cost effective shell measures and additional commercial kitchen measures. Measures with low achievable potential, technologies new to the marketplace or where natural gas is used for process will continue to be evaluated on a site specific basis.

We believe that by adding additional prescriptive measures, the program will be accessible by a greater number of customers, will be easier to manage at less cost and will result in higher participation levels in the small to medium sized customer segments. Measures not included in the prescriptive program will continue to be evaluated on a site specific basis.

Avista plans to increase efforts to identify cost effective, site specific opportunities with our larger non-residential customers. Resources will be reallocated to support this initiative.

In addition, we will continue to look for opportunities to work cooperatively with the ETO where site specific efficiency projects are identified. We will also work closely with local land-use planners and energy consultants on new non-residential projects to influence energy efficiency decisions during the design phase.

### **MEASURE DEVELOPMENT**

Avista will continue to look at the “best fit” for program implementation. Implementation options could include a combined effort between Avista’s North and South divisions, additional staffing, Energy Trust of Oregon (ETO), trade partners, and if developed, regional transformation efforts through a natural gas Northwest Energy Efficiency Alliance (NEEA).

## NORTH DIVISION DSM PORTFOLIO

Conservation measures have been offered to Washington and Idaho customers without interruption since 2001 and periodically prior to that time.

A non-binding external oversight group, the External Energy Efficiency (“Triple-E”) Board, has been established to provide guidance for the implementation of DSM measures. This board is provided with monthly and quarterly updates, convenes twice a year and receives a comprehensive annual evaluation of acquisition and cost-effectiveness.

Avista’s Rate Schedule 190 provides the regulatory guidelines for the implementation of DSM measures. This tariff prescribes a set of tiered, direct financial incentives, as illustrated in Table 4.1.1, based on the customer simple payback of the measure.

<b>Simple Pay-back Period</b>	<b>Incentive Level (\$/first year therm)</b>
1 to 2 years	\$2.00
2 to 4 years	\$2.50
4 to 6 years	\$3.00
Over 6 years	\$3.50

Exceptions to these tiered incentives allow us flexibility to respond to unexpected or unique opportunities. This flexibility includes an additional set of tiered incentives, permitting higher incentives for the development of new technologies and market transformation efforts.

The original 2001 Schedule 190 tariff established an annual goal of 240,000 first-year therms. Almost immediately upon launch of the renewed gas-efficiency program, commodity-driven escalations in retail rates during the 2001 Western energy crisis drove acquisition well beyond these levels. Initial concerns that this higher level of acquisition may be unsustainable proved to be unfounded. A reassessment of the market in the 2007 Gas IRP process resulted in the establishment of a 1,425,070 annual therm goal for 2008 and 1,581,828 for 2009. The 2008 goal has proven to be achievable. Whether or not the 2009 goal is achievable remains to be seen as customers react within a struggling economy.

Beginning in 2015, carbon mitigation and other cost adders we model lead to significantly increased avoided cost in later years. The corresponding increased measure selection by our model results in preliminary 2010 and 2011 savings goals which will be a challenge. Current declining retail rates for our customers make it difficult to influence them to react to forecasted price increases. Alternate scenarios modeled without the adders result in goals more inline with historical IRP goals.

---

It is possible that detailed implementation planning will result in the recommendation for revisions to the incentive levels, caps and applicable markets, and technologies as part of an overall strategy to meet the commitments made for increased long-term resource acquisition identified within this IRP.

Our conservation offerings within our North Division are accompanied by a mix of electric measures. In 2008 the natural gas share of the total BTU savings from the overall portfolio was 88 percent. This share shifts over time depending on resource opportunities, retail rates, technical advancements and customer interest. DSM implementation efforts within the North Division are further subdivided into three different portfolios; (1) the non-residential portfolio, (2) the residential portfolio and (3) the low-income residential portfolio. The approaches to the implementation of these three portfolios differ significantly in recognition of the differences in these market segments.

### **NON-RESIDENTIAL SEGMENT**

While the non-residential portfolio has access to prescriptive measures, it is mainly characterized by its non-prescriptive approach to this market which provides incentives for any cost-effective project. Financial incentives are offered for projects based on the tiered incentive structure described above. This approach ensures that the unique operating characteristics of commercial and industrial customers are recognized. Prescriptive programs are limited to measures and applications with standard energy savings and cost characteristics or where a standardized approach can be developed. To simplify programs for our customers and trade allies and maximize program participation, we have been shifting towards more prescriptive non-residential programs.

In 2008, Avista acquired 1,036,424 therms from this portfolio (55 percent of the total acquisition of all three segments). Fifty-four percent of the total non-interactive energy (electric and natural gas) acquisition is attributable to therm saving within this segment.

Large projects, those resulting in incentives of \$100,000 or larger, are disclosed to the Triple-E board to provide them with the information necessary to provide oversight of DSM programs.

### **RESIDENTIAL SEGMENT**

Due to the large volume and relatively small size of individual projects, the residential portfolio is exclusively composed of prescriptive programs. In 2008 this portfolio was responsible for the acquisition of 749,199 first-year therms (40% of the total acquisition of all three segments). Of the non-interactive total energy (electric and natural gas) savings in 2008 from this portfolio, 39 percent are attributable to therm savings of this segment.

Incentives available for residential programs are calculated based on the application of the measure in a typical residential home or, in some cases, based on deemed savings. Calculations are made in accordance with Avista Rate Schedule 190 tiered incentives with appropriate modifications for potential differences in application, multiple measure programs and rounding for purposes of offering a customer and trade ally-friendly program. The prescriptive residential programs currently available are natural gas furnaces/boilers, high efficiency water heaters, tankless water heaters, ceiling/attic insulation, floor/wall insulation, windows, and rooftop dampers.

Notably, several multifamily housing measures are incorporated within the residential segment due to the non-residential electric and natural gas rate schedules that many of these customers are billed. Many of the multifamily measures evaluated as part of this IRP analysis (e.g. pool and spa water heating efficiencies in multifamily housing) will be forwarded to the residential segment implementation team for further evaluation.

Avista is continuing an outreach effort targeted at residential customers within our service territory through involvement at area community events. The outreach effort is geared toward improving conservation by providing continuing educational messages regarding behavioral effects on energy use as well as encouraging customers to participate in programs that improve the efficiency of key natural gas appliances or shell measures.

In addition, we continue our multi-channel, multi-year educational outreach effort, known as Every Little Bit. Included in this effort is an website, [www.everylittlebit.com](http://www.everylittlebit.com), which provides a one-stop shop for energy efficiency information and tips, available rebates, latest information on renewable energy, as well as an interactive audit tool where customers can audit their home's energy efficiency and gain insight on improvements that can be made.

### LOW-INCOME RESIDENTIAL SEGMENT

Avista's north division low income programs are implemented in cooperation with six community action partnership (CAP) agencies. These CAP agencies are awarded an annual funding contract specifying the maximum funding amounts and the conditions for program implementation. Contracts can be revised on 30 days' notice, a provision that allows Avista flexibility to reallocate funds among the CAP agencies during the year to maximize their value to the customer base.

The CAP agencies and 2008/2009 funding levels are summarized in Table 4.1.2.

<b>Community Action Partner</b>	<b>2008 Budget</b>	<b>2009 Budget</b>
Lewiston CAP	\$480,937	\$660,000
North Columbia CAC (Moses Lake)	97,316	125,000
Rural Resources CA (Colville)	81,990	105,000
SNAP (Spokane)	722,919	950,000
Whitman County CAC (Pullman)	95,758	125,000
WGAP (White Salmon)	3,080	7,000
	<u>\$1,482,000</u>	<u>\$1,972,000</u>

The distribution of funding for the low income segment has been approached with the intent to provide the maximum flexibility possible. This permits the agencies to respond to unexpected urgent needs and energy-efficiency opportunities that may not have been anticipated when the annual contracts were signed.

As part of this flexibility, the CAP agencies are permitted to expend their contractual funding on either electric or natural gas-efficiency measures. The funding available includes an allowable 15 percent remuneration to the agency for administrative and outreach costs. Up to 15 percent of the

---

funds can be expended for health and human safety measures with an emphasis on the safe use of energy, and maintenance and repairs necessary to ensure the longevity of installed efficiency measures and continued habitability of the home.

The low income residential segment delivered 102,438 first-year therms to the overall natural gas DSM program in 2008. This therm acquisition represented 5 percent of the total BTUs acquired by the combined electric and natural gas programs.

## **PROGRAM FUNDING**

Avista's approach to conservation cost-recovery is through a public purpose surcharge on our customer's energy bill (the tariff rider). We currently manage separate tariff riders for Washington and Idaho natural gas investments. Based upon the demand for funds and incoming tariff rider contributions, this balance can be positive (shareholders owe customers) or negative (customers owe shareholders) at any particular point in time.

The aggregate natural gas tariff rider balance for the north division is a negative (customer owes shareholders) \$4,047,415 as of July 30, 2009. Recent demand for conservation services has exceeded tariff rider revenue. Therefore, we recently requested increases to Schedule 191, the most recent of which went into effect in Idaho on August 1, 2009. The most recent projection forecasts a positive (shareholders owe customers) \$74 thousand balance in the Washington natural gas DSM tariff rider and just below \$21 thousand positive in the Idaho natural gas tariff balance by year end 2010.

Funding for the natural gas efficiency programs is derived through a surcharge on retail rates authorized under Schedule 191. The recent increases to the Washington and Idaho natural gas surcharges were necessary to eliminate a persistent imbalance of tariff rider contributions and natural gas program expenditures. This imbalance tends to grow during the periods of increasing commodity costs and we continue to see higher than budgeted demand in program incentives. For example, in 2008 natural gas tariff rider contributions were over \$4.3 million while we paid customers nearly \$5.1 million in natural gas incentives, making incentives 117% of tariff rider contributions collected. Prior to consideration of infrastructure and other implementation costs, this puts Avista in a situation of a negative balance.

Only those customers contributing to the program funding through Avista Rate Schedule 191 are eligible to receive financial incentives. This limits availability to core natural gas customers. Periodically we claim the acquisition of natural gas savings from transport customers if those efficiencies result from involvement in a project that is tightly interwoven with an electric-efficiency project that was being evaluated and funded under the company's electric DSM program.

## **COOPERATIVE REGIONAL PROGRAMS**

Avista has and remains interested in testing the viability of a regional market transformation approach to the acquisition of natural gas-efficiency potential. This model has proven to be

---

successful within Northwest electric markets as evidenced by the success of the Northwest Energy Efficiency Alliance (NEEA). Though recent efforts at partnering with NEEA and establishing limited ad hoc regional efforts on the natural gas side have been unsuccessful, we will continue to seek alliances with other Northwest utilities to advance this concept.

## CONCLUSION

We have explicitly recognized within this IRP our obligation to achieve all natural gas-efficiency resources available through utility intervention of cost-effective programs. Given the rapid changes within the natural gas market, many new efficiency opportunities may arise in the market. The Company will continue to consider and evaluate any developing technologies for inclusion in our programs between IRPs. Considerable uncertainty remains regarding the customer response to these programs, since this is a time of economic uncertainty at a time when retail gas prices are declining. Historically, we have seen less participation as prices decline. However, this uncertainty does not preclude us from pursuing the planned aggressive ramp-up of natural gas-efficiency programs. Additionally, we have, and will continue to actively seek, opportunities for new or enhanced resource acquisition through the development of cooperative regional programs.

One of the results of the IRP process is a 20-year forecast of avoided costs for each of the eight geographic areas. The detailed nature of these avoided costs makes it possible to continue to evaluate measures and applications as technology and markets change without the need to await the next IRP process. This is of value in determining program cost effectiveness based upon updated inputs, revised program plans and the ability to determine the value of targeting specific markets. Avoided cost determination is discussed in detail in Chapter 6 – Integrated Resource Portfolio.

The completion of the IRP analysis is the midpoint, not the ending point, of a larger reassessment of the DSM resource portfolio. The IRP analysis presented has generally indicated a set of cost effective measures and achievable resource potential for a future DSM portfolio. These results remain in need of further evaluation to facilitate the development of program plans and to incorporate them into an updated DSM implementation plan for use in daily DSM operations.

**APPENDIX 4.4**

**ENVIRONMENTAL EXTERNALITIES**

## APPENDIX 4.4 – ENVIRONMENTAL EXTERNALITIES (OREGON JURISDICTION ONLY)

---

### OVERVIEW

The methodology for determining avoided costs from reduced incremental natural gas usage considers commodity and variable transportation costs only. These avoided cost streams do not include environmental externality costs related to the gathering, transmission, distribution or end-use of natural gas.

Per traditional economic theory and industry practice, an environmental externality factor is typically added to the avoided cost when there is an opportunity to displace traditional supply-side resources with an alternative resource with no adverse environmental impact.

### REGULATORY GUIDANCE

The Oregon Public Utility Commission (OPUC) issued Order 93-965 (UM-424) to address how utilities should consider the impact of environmental externalities in planning for future energy resources. The Order required analysis on the potential natural gas cost impacts from emitting carbon dioxide (CO<sub>2</sub>) and nitric-oxide (NO<sub>x</sub>).

The OPUC's Order No. 07-002 in Docket UM 1056 (Investigation Into Integrated Resource Planning) established the following guideline for the treatment of environmental costs used by energy utilities that evaluate demand-side and supply-side energy choices:

UM 1056, Guideline 8 - Environmental Costs

*“Utilities should include, in their base-case analyses, the regulatory compliance costs they expect for carbon dioxide (CO<sub>2</sub>), nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>2</sub>), and mercury (Hg) emissions. Utilities should analyze the range of potential CO<sub>2</sub> regulatory costs in Order No. 93-695, from \$0 - \$40 (1990\$). In addition, utilities should perform sensitivity analysis on a range of reasonably possible cost adders for nitrogen oxides (NO<sub>x</sub>), sulfur dioxide (SO<sub>2</sub>), and mercury (Hg), if applicable.*

In June 2008, the OPUC issued Order 08-338 (UM1302) which revised UM1056, Guideline 8. The revised guideline requires the utility should construct a base case portfolio to reflect what it considers to be the most likely regulatory compliance future for the various emissions. Additionally the guideline requires the utility to develop several compliance scenarios ranging from the present CO<sub>2</sub> regulatory level to the upper reaches of credible proposals and each scenario should include a time profile of CO<sub>2</sub> costs. The utility is also required to include a “trigger point” analysis in which the utility must determine at what level of carbon costs its selection of portfolio resources would be significantly different.

### ANALYSIS

Unlike electric utilities, environmental cost issues rarely impact a natural gas utility's supply-side resource options. This is because the only supply-side energy resource is natural gas. The utility cannot choose between say "dirty" coal-fired generation and "clean" wind energy sources. The supply-side implication of environmental externalities generally relates to combustion of fuel to move or compress natural gas. Avista's direct gas distribution system infrastructure relies solely on the upstream line pressure of the interstate

---

pipeline transportation network to distribute natural gas to its customers and thus does not directly combust fuels that result in any CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>2</sub>, or Hg emissions.

Upstream gas system infrastructure (pipelines, storage facilities, and gathering systems), however, do produce CO<sub>2</sub> emissions via compressors used to pressurize and move natural gas. Accessing CO<sub>2</sub> emissions data on these upstream activities to perform detailed meaningful analysis is challenging but increasingly important given building momentum around legislative developments regarding GHG legislation and the movement towards the creation of carbon cap and trade markets. Avista believes the cap and trade proposals being contemplated are the likely form of environmental externality cost capture versus a carbon tax framework. Under either structure, Avista believes the cost pass through mechanisms for upstream gas system infrastructure will not make a difference in supply-side resource selection although the amount of cost pass through could differ widely.

Table 4.2.1 summarizes a range of environmental cost adders we believe capture several compliance futures including our expected scenario and upper reaches of credible proposals. The CO<sub>2</sub> cost adders reflect outlooks we obtained from one of our consultants, and following discussion and feedback from the TAC, have been incorporated into each of our six demand scenarios at various assumption levels.

The guidelines also call for a trigger point analysis that reflects a “turning point” at which an alternate resource portfolio would be selected at different carbon cost adders levels. Because natural gas is the only supply resource applicable to LDC’s any alternate resource portfolio selection would be a result of delivery methods of natural gas to customers. Conceptually, there could be differing levels of cost adders applicable to pipeline transported supply versus in service territory LNG storage gas. From a practical standpoint however, the differences in these relative cost adders would be very minor and would not change supply-side resource selection regardless of various carbon cost adder levels. We do acknowledge there is influence on the level of demand-side measures that could be cost effective. This alternate demand-side resource portfolio selection is captured in our overall process of comparing demand-side and supply-side resources described in Chapter 4 – Demand-Side Resources.

## CONSERVATION COST ADVANTAGE

For this IRP, we also incorporated a 10 percent environmental externality factor into our assessment of the cost-effectiveness of existing demand-side management programs. Our assessment of prospective demand-side management opportunities is based on an avoided cost stream that includes this 10 percent factor.

Environmental externalities were evaluated in the IRP by adding the cost per therm equivalent of the externality cost values to supply-side resources as described in OPUC Order No. 93-965. Avista found that the environmental cost adders had no impact on the company’s supply-side choices, although they did impact the level of demand-side measures that could be cost-effective to acquire.

## REGULATORY FILING

Avista will file revised cost-effectiveness limits (CELs) based upon the updated avoided costs available from this IRP process within the prescribed regulatory timetable. We anticipate this will occur in early 2010.

### **SUPPLY SIDE RESOURCE OPTIONS**

Appendix 6.3 - Supply Side Resource Additions Available to SENDOUT®				
Additional Resources	Jurisdiction	Size	Cost/Rates	Availability
<b>Pipeline</b>				<b>Notes</b>
Capacity Release Recalls	WA/ID	20,000 Dth/d	NWPPL fixed rate	2018 Recall previously released capacity
GTN Capacity	WA/ID	30,000 Dth/d	GTN rate	2010 Currently available unsubscribed capacity; requires expansion of 2010 Medford Lateral
GTN Capacity	OR	25,000 Dth/d	GTN rate	Additional compression to allow more gas to flow from GTN mainline to 2011 the lateral
GTN Medford Lateral Expansion	OR	25,000 Dth/d	GTN rate	2013 Transport expansion from Sumas/JP to WA/ID
NWP Expansion	WA/ID	50,000 Dth/d	NWPPL fixed rate x 3	2013 Transport expansion from Sumas/JP to Oregon
NWP Expansion	OR	50,000 Dth/d	NWPPL fixed rate x 5	2009 Currently available unsubscribed capacity
Klamath Falls Lateral Capacity	OR	up to 6000 Dth/d	NWPPL fixed rate	Agreement with NWPPL to purchase the Klamath Falls lateral at net November 2010 book value. Can be done with less than 1 years notice.
Klamath Falls Lateral Purchase	OR	20,000 Dth/d	\$2.5 million capital cost	November 2010 book value. Can be done with less than 1 years notice.
<b>Statellite LNG</b>				
WA/ID Statellite LNG	WA/ID	90,000 capacity; 30,000 delivery for 3 days	\$44 million capital cost \$1 million annual O&M	November 2015
Medford/Roseburg Statellite LNG	OR	45,000 capacity; 15,000 delivery for 3 days	\$22 million capital cost \$850,000 annual O&M	November 2015
Klamath Falls Statellite LNG	OR	45,000 capacity; 15,000 delivery for 3 days	\$22 million capital cost \$850,000 annual O&M	November 2015
La Grande Statellite LNG	OR	45,000 capacity; 15,000 delivery for 3 days	\$22 million capital cost \$850,000 annual O&M	November 2015
<b>Company Owned Liquefaction LNG</b>				
WA/ID	WA	600 MMcf capacity; 150,000 delivery for 4 days	\$75 million capital cost, \$2 million annual O&M	November 2017
<b>Import LNG</b>				
Jordan Cove LNG to Medford	OR	7,500 Dth/d	Malin pricing less fuel	November 2012
Transport from LNG Terminal	OR	7,500 Dth/d	Precedent agreement rate	November 2012
Jordan Cove LNG to Malin	OR	7,500 Dth/d	Malin pricing less fuel	November 2012
Transport from LNG Terminal	OR	7,500 Dth/d	Precedent agreement rate	November 2012
Bradwood Landing LNG	OR	25,000 Dth/d	Malin pricing less fuel	November 2012
Transport from LNG Terminal	OR	25,000 Dth/d	Precedent agreement rate	November 2012
<b>Other Resources Considered</b>				
Citygate deliveries	WA/ID/OR			Represents the ability to buy a delivered product from another utility or marketer. Limited counterparties to structure transaction
Malin Backhaul	OR		GTN rate	Back haul capacity is provided by displacement and is available up to the amount of scheduled forward-haul capacity through a specific point. Also requires expansion of the Medford Lateral to facilitate delivery.
<b>Inground Storage</b>				2010 Not firm especially long term
California				Dependent on GTN backhaul or convert to bidirectional pipeline
JP Expansion				Dependent on NWP Expansion or other Tport arrangements back to service territory
Mist				Dependent on NWP Expansion or other Tport arrangements back to service territory; Long term subscription may not be available

## **APPENDIX 6.5**

### **SENDOUT® MODEL DIAGRAM**

## **APPENDIX 7.1**

# **SENSITIVITIES, SCNEARIOS, SIMULATIONS, AND PORTFOLIOS LIST**

Appendix 7.1 - Avista 2009 IRP Sensitivities, Scenarios, Simulations, and Portfolios

SENDOUT#	Sensitivity, Portfolio, or Simulation	Case Name	Demand Scenario	Supply Scenario	Major Assumptions
1111	Portfolio	Expected Case	Expected Case	Current Resources	Coldest day on record, expected customer growth rates, expected price curve, low elasticity, carbon adder \$5-\$67
1113	Portfolio	Expected Case	Expected Case	Current plus currently available	Includes current transportation network, recalls of capacity releases, unsubscribed transport on existing pipelines, capacity expansions, capacity releases, and backhauls.
1120	Portfolio	Expected Case	Expected Case	GTN Turnback Double Cost	Expected case demand assumptions plus current supply resources and currently available resources. However, the GTN rates are doubled to incorporate the major turnback of capacity on their system.
1121	Portfolio	Expected Case	Expected Case	GTN Line Decommission	Expected case demand assumptions plus current supply resources and currently available resources. However, there is no more available capacity on GTN's system due to the decommissioning of one of their lines caused by capacity turnback.
1110	Portfolio	Coldest in 20 Years	Coldest in 20 Years	Current Resources	Coldest day in the last 20 years, expected customer growth rates, expected price curve, expected elasticity, carbon adder, \$5-\$67
1114	Portfolio	Supply Constrained	Supply Constrained	Existing Resources	Coldest day on record, expected customer growth rates, high price curve, expected elasticity, carbon adder \$5-\$67, \$30 drilling constraints adder, and \$20 to \$3.00 Canadian drilling declines.
1109	Portfolio	Green Future	Green Future	Current Resources	Coldest day on record, 50% increase in customer growth rates, low price curve, low elasticity, carbon adder \$5-\$67
1108	Portfolio	High Growth & Low Prices	High Growth & Low Prices	Current Resources	Includes current transportation network, recalls of capacity releases, unsubscribed transport on existing pipelines, citygate purchases, and backhauls.
1115	Portfolio	High Growth & Low Prices	High Growth & Low Prices	Current plus currently available	Coldest day on record, 50% decrease in customer growth rates, high price curve, high elasticity, carbon adder \$5-\$67, drilling constraints adder \$1.
1107	Portfolio	Low Growth & High Prices	Low Growth & High Prices	Current Resources	Expected case demand assumptions updated with medium price elasticity and price curve plus current supply resources.
1117	Portfolio	Expected with Medium Elasticity	Expected Case	Current Resources	Expected case demand assumptions updated with medium price elasticity and price curve plus current supply resource and currently available supply resources.
Portfolio		Expected Case	Expected Case	Current Resources plus currently available	Expected case demand assumptions updated with high price elasticity and price curve plus current supply resources.
1118	Portfolio	Expected with High Elasticity	Updated Expected with High Elasticity	Current Resources	Coldest day on record, expected customer growth rates, flat use per customer, no elasticity, expected price curve, no carbon adders or drilling constraints
1022	Sensitivity	Reference Case	Reference Case	Current Resources	Reference case assumptions plus low elasticity
1011	Sensitivity	Low Elasticity	Low Elasticity	Current Resources	Reference case assumptions plus high elasticity
1009	Sensitivity	High Elasticity	High Elasticity	Current Resources	Reference case assumptions with peak HDD's less 1
1008	Sensitivity	Peak Day-1	Peak Day-1	Current Resources	Reference case assumptions with low customer growth rates
1018	Sensitivity	Low Growth	Low Growth	Current Resources	Reference case assumptions with high customer growth rates
1017	Sensitivity	High Growth	High Growth	Current Resources	Reference case with coldest day in 20 years as the planning standard
1021	Sensitivity	Coldest in 20 Years	Coldest in 20 Years	Current Resources	Reference case assumptions with \$50 adder for competition for Canadian gas
1015	Sensitivity	Canada Dry 1	Canada Dry 1	Current Resources	Reference case assumptions with increasing demand due to CNG vehicle penetration.
1007	Sensitivity	Peak Day-2	Peak Day-2	Current Resources	Reference case with \$5-\$67/ton carbon adder
1014	Sensitivity	CNG Vehicles	CNG Vehicles	Current Resources	Reference case with \$37-\$140/ton adder
1013	Sensitivity	Carbon Mitigation 2	Carbon Mitigation 2	Current Resources	Reference case assumptions with high price curve
1012	Sensitivity	Carbon Mitigation 1	Carbon Mitigation 1	Current Resources	Reference case assumptions with low price curve
1019	Sensitivity	High Price	High Price	Current Resources	Reference case assumptions plus expected elasticity
1020	Sensitivity	Low Price	Low Price	Current Resources	Reference case with \$30 adder for drilling constraints
1010	Sensitivity	Expected Elasticity	Expected Elasticity	Current Resources	Expected case demand assumptions with 200 draws of weather, used to determine unserved impact and frequency of peak day.
1016	Sensitivity	Drilling Constrains	Drilling Constrains	Current Resources	Expected case demand assumptions with 200 draws of weather, used to determine unserved impact and frequency of peak day.
Simulation		Weather Monte Carlo	Expected Case	Current Resources	Expected case demand assumptions with 200 draws or price, used to assess the risk to customers of price variability.
1023	Simulation	Price Monte Carlo	Expected Case	Current Resources plus currently available

### Appendix 7.4 Load Duration Curve & Resource Stack

(Demand shown net of DSM)  
Low Case - OR

## **APPENDIX 7.5**

### **TOTAL COST BY PORTFOLIO**

### Appendix 7.5 - Net Present Value of Revenue Requirement (NPVRR) by Portfolio

Portfolio	NPVRR in (000's)	
<b><i>Expected Case</i></b>		
Expected Demand with Existing Resources (before resource additions)	\$	(6,514,895)
Expected Demand with Existing Resources plus Expected Available	\$	(6,547,705)
Expected Demand with GTN Fully Subscribed	\$	(6,593,845)
Expected Demand with GTN Rate Escalation	\$	(7,440,510)
<b><i>Additional Demand Scenarios</i></b>		
Expected Demand with High Elasticity and Existing Resources	\$	(5,856,847)
Expected Demand with Expected Elasticity and Existing Resources	\$	(6,249,435)
Coldest in 20 Demand with Existing Resources	\$	(7,997,147)
High Growth & Low Price Demand with Existing Resources	\$	(7,691,204)
High Growth & Low Price Demand with Existing Resource plus Expected Available	\$	(10,704,833)
Green Future with Existing Resources	\$	(9,277,241)
Low Growth & High Prices with Restricted Capacity	\$	(10,814,967)
Supply Constrained with Existing Resources	\$	(11,782,862)

## **APPENDIX 8.1**

### **DISTRIBUTION SYSTEM MODELING**

## APPENDIX 8.1 – DISTRIBUTION SYSTEM MODELING

---

### OVERVIEW

The primary goal of distribution system planning is to design for present needs and to plan for future expansion to serve demand growth. This allows Avista to satisfy current demand-serving requirements while taking steps toward meeting future needs. Distribution system planning identifies potential problems and areas of the distribution system that require reinforcement. By knowing when and where pressure problems may occur, the necessary reinforcements can be incorporated into normal maintenance. Thus, more costly reactive and emergency solutions can be avoided.

### COMPUTER MODELING

When designing new main extensions, computer modeling can help determine the optimum size facilities for present and future needs. Undersized facilities are costly to replace, and oversized facilities incur unnecessary expenses to Avista and its customers.

### THEORY AND APPLICATION OF STUDY

Natural gas network load studies have evolved in the last decade to become a highly technical and useful means of analyzing the operation of a distribution system. Using a pipeline fluid flow formula, a specified parameter of each pipe element can be simultaneously solved. A variety of pipeline equations exist, each tailored to a specific flow behavior. Through years of research, these equations have been refined to the point where solutions obtained closely represent actual system behavior.

Avista conducts network load studies using Advantica's SynerGEE<sup>®</sup> 4.3.0 software. This computer-based modeling tool runs on a Windows operating system and allows users to analyze and interpret solutions graphically.

### CREATING A MODEL

To properly study the distribution system, all natural gas main information is entered (length, pipe roughness and ID) into the model. "Main" refers to all pipelines supplying services.

Nodes (points where natural gas enters or leaves the system) are placed at all pipe intersections, beginnings and ends of mains, changes in pipe diameter/material and to identify all large customers. A model element connects two nodes together. Therefore, a "to node" and a "from node" will represent an element between those two nodes. Almost all of the elements in a model are pipes.

Regulators are treated like adjustable valves in which the downstream pressure is set to a known value. Although specific regulator types can be entered for realistic behavior, the expected flow passing through the actual regulator is determined and the modeled regulator is forced to accommodate such flows.

## FLUID MECHANICS OF THE MODEL

Pipe flow equations are used to determine the relationships between flow, pressure drop, diameter and pipe length. For all models, the Fundamental Flow equation (FM) is used due to its demonstrated reliability.

Efficiency factors are used to account for the equivalent resistance of valves, fittings and angle changes within the distribution system. Starting with a 95 percent factor, the efficiency can be changed to fine tune the model to match field results.

Pipe roughness along with flow conditions creates a friction factor for all pipes within a system. Thus, each pipe may have a unique friction factor, minimizing computational errors associated with generalized friction values.

## LOAD DATA

All studies are considered steady state; all natural gas entering the distribution system must equal the natural gas exiting the distribution system at any given time.

Customer loads are obtained from Avista’s customer billing system and converted to an algebraic format so loads can be generated for various conditions.

In the event of a peak day or an extremely cold weather condition, it is assumed that all curtailable loads are interrupted. Therefore, the models will be conducted with only core loads.

## DETERMINING NATURAL GAS CUSTOMERS’ MAXIMUM HOURLY USAGE

### *Determining a Base Load*

Base loads are not temperature dependent; they remain relatively constant regardless of temperature. A reasonable base load can be calculated from customer billing information. The billing month, which has the lowest amount of heating degree days is usually August. Usage during this month will reflect nearly all natural gas loads exclusive of space heating.

By determining the amount of days in the billing period and applying a peaking factor, the peak hourly base load of each customer can be estimated as shown in Table 1:

Table 1 - Determining Base Load					
<b>Customer Usage</b>	X	$\frac{1}{\text{Days in Billing Period}}$	X	0.0625*	= <b>Peak Hourly Base Load</b>
<b>Summer Billing Period</b>					

\* The average residential customer’s peak usage was found to be 6.25 percent of the total daily load. This peaking factor was estimated by studying the ratio of the peak hourly flow and the total daily flow at the pipeline gate stations in past years. The peaking factor is periodically discussed with other utilities and has been consistent with other utilities of similar size.

### Determining Heat Load

A heat load will be proportional to heating degree-days (HDDs); at 0 HDD, the load will be zero. A heat load can be reasonably calculated from customer billing information. The billing month with the greatest consumption is usually January. This month reflects maximum space heating as well as non-space heating loads.

Customers’ usage for January (winter) billing, minus usage for August (summer) billing, leaves a reasonable estimate for heat load. This load can be divided by the amount of HDDs that occurred in January, leaving usage per HDD. Customer needs can be calculated by applying the peaking factor, resulting in a peak hourly heat load per HDD. This is shown in Table 2:

Table 2 - Determining Heat Load										
$\left\{ \begin{array}{l} \text{Customer Usage} \\ \text{Winter Billing} \\ \text{Period} \end{array} \right.$	-	$\left\{ \begin{array}{l} \text{Customer Usage} \\ \text{Summer Billing} \\ \text{Period} \end{array} \right.$	X	$\frac{1}{\text{Winter Billing Period Degree Days}}$	X	Peak HDDs	X	0.0625*	=	Peak Hourly Heat Load

### Determining Design Peak Hourly Load

The design peak hourly load for a customer is estimated by adding the hourly base load and the hourly heat load for a design temperature. This estimate reflects highest system hourly demands, as shown in Table 3:

Table 3 - Determining Peak Hourly Load			
Peak Hourly Base Load	+	Peak Hourly Heat Load	= Peak Hourly Load

This method differs from the approach that we use for IRP peak day load planning. The primary reason for this difference is due to the importance of responding to hourly peaking in the distribution system, while IRP resource planning focuses on peak day requirements to the city gate.

### APPLYING LOADS

Having estimated the peak loads for all customers in a particular service area, the model can be loaded. The first step is to assign each load to the respective node or element.

### GENERATING LOADS

Temperature-based and non-temperature-based loads are established for each node or element, thus loads can be varied based on any temperature (HDD). Such a tool is necessary to evaluate the difference in flow and pressure due to different weather conditions.

---

## **GEOGRAPHIC INFORMATION SYSTEM (GIS)**

We have recently converted our natural gas facility maps to GIS. While the GIS can provide a variety of map products, its power lies in its analytical capability. A GIS consists of three components: spatial operations, data association and map representation.

A GIS allows analysts to conduct spatial operations (relating a feature or facility to another geographically). A spatial operation is possible if a facility displayed on a map maintains a relationship to other facilities. Spatial relationships allow analysts to perform a multitude of queries, including:

- identify electric customers adjacent to natural gas mains who are not currently using natural gas;
- display the ratio of customers to length of pipe in Emergency Operating Procedure zones (geographical areas defined by the number of customers and their safety in the event of an emergency); and
- classify high-pressure pipeline proximity criteria.

The second component of the GIS is data association. This allows analysts to model relationships between facilities displayed on a map to tabular information in a database. Databases store facility information such as pipe size, pipe material, pressure rating, or related information (e.g., customer databases, equipment databases and work management systems). Data association allows interactive queries within a map-like environment.

Finally, the GIS provides a means to create maps of existing facilities in different scales, projections and displays. In addition, the results of a comparative or spatial analysis can be presented pictorially. This allows users to present abstract analyses in a more intuitive context.

## **BUILDING SynerGEE® MODELS FROM A GIS**

The GIS can provide additional benefits through the ease of creation and maintenance of load studies. Avista can create load studies from the GIS based on tabular data (attributes) installed during the mapping process.

## **MAINTENANCE USING A GIS**

The GIS helps maintain the existing distribution facility by allowing a design to be initiated on a GIS. Currently, design jobs for the company's natural gas system are managed through Avista's Facility Management (AFM) tool. This system is being integrated with GIS, allowing jobs to be designed directly within a GIS. Once completed, the as-built information is submitted to GIS and the facility is immediately updated. This eliminates the need to convert physical maps to a GIS at a later date. Because the facility is updated on GIS, load studies can remain current by refreshing the analysis.

---

## DEVELOPING A PRESENT CASE LOAD STUDY

In order for any model to have accuracy, a present case model has to be developed that reflects what the system was doing when downstream pressures and flows are known. To establish the present case, pressure charts located throughout the distribution system are used.

Pressure charts plot pressure (some include temperature) versus time over several days. Various locations recording simultaneously are used to validate the model. Customer loads on SynerGEE<sup>®</sup> are generated to correspond with actual temperatures recorded on the pressure charts. An accurate model's downstream pressures will match the corresponding location's field pressure chart. Efficiency factors are fine-tuned to further refine the model's pressures.

Since telemetry at the gate stations record hourly flow, temperature and pressure, these values are used to validate the model. All loads are representative of the average daily temperature and are defined as hourly flows. If the load generating method is truly accurate, all natural gas entering the actual system (physical) equals total natural gas demand solved by the simulated system (model).

## DEVELOPING A PEAK CASE LOAD STUDY

Using the calculated peak loads, a model can be analyzed to identify the behavior during a peak day. The efficiency factors established in the present case are used throughout subsequent models.

## ANALYZING RESULTS

After a model has been balanced, several features within the SynerGEE<sup>®</sup> model are used to translate results. Color plots are generated to depict flow direction, pressure, pipe diameter and gradient with specific break points. Reinforcements can be identified by visual inspection. When user edits are completed and the model is re-balanced, pressure changes can be visually displayed, helping identify optimum reinforcements.

An optimum reinforcement will have the largest pressure increase per unit length. Reinforcements can also be deferred and occasionally eliminated through load mitigation of DSM efforts.

## PLANNING CRITERIA

In most instances, models resulting in node pressures below 15 psig indicate a likelihood of distribution low pressure and therefore necessitate reinforcements. For most Avista distribution systems, a minimum of 15 psig will ensure deliverability as natural gas exits the distribution mains and travels through service pipelines to a customer's meter. Some Avista distribution areas operate at lower pressures and are assigned a minimum pressure of 5 psig for model results. Given a lower operating pressure, service pipelines in such areas are sized accordingly to maintain reliability.

## DETERMINING MAXIMUM CAPACITY FOR A SYSTEM

Using a peak day model, loads can be prorated at intervals until area pressures drop to 15 psig. At that point, the total amount of natural gas entering the system equals the maximum capacity before

new construction is necessary. The difference between natural gas entering the system in this scenario and a peak day model is the maximum additional capacity that can be added to the system.

Since the approximate natural gas usage for the average customer is known, it can be determined how many new customers can be added to the distribution system before necessitating system reinforcements. The above models and procedures are utilized with new construction proposals or pipe reinforcements to determine a potential increase in facilities.

### **FIVE-YEAR FORECASTING**

The intent of our load study forecasting is to predict the system's behavior and reinforcements necessary within the next five years. Various Avista personnel provide information to determine where and why certain areas may experience growth.

By combining information from Avista's demand forecast, IRP planning efforts, regional growth plans and area developments, proposals for pipeline reinforcements and expansions can be evaluated with SynerGEE®.
